APPENDIX G – Disposal Documentation

APPENDIX H – Laboratory Analytical Data

LIST OF ACRONYMS

Acronym	Definition
AOC	Area of Concern
CAMP	Community Air Monitoring Plan
COC	Contaminant of Concern
CPP	Citizen Participation Plan
CSM	Conceptual Site Model
DER-10	New York State Department of Environmental Conservation Technical Guide 10
FID	Flame Ionization Detector
GPS	Global Positioning System
HASP	Health and Safety Plan
HAZWOPER	Hazardous Waste Operations and Emergency Response
IRM	Interim Remedial Measure
NAPL	Non-aqueous Phase Liquid
NYC VCP	New York City Voluntary Cleanup Program
NYC DOHMH	New York City Department of Health and Mental Hygiene
NYC OER	New York City Office of Environmental Remediation
NYS DOH ELAP	New York State Department of Health Environmental Laboratory Accreditation Program
OSHA	Occupational Safety and Health Administration
PID	Photoionization Detector
QEP	Qualified Environmental Professional
RI	Remedial Investigation
RIR	Remedial Investigation Report
SCO	Soil Cleanup Objective
SPEED	Searchable Property Environmental Electronic Database

CERTIFICATION

I, Michelle Lapin, am a Qualified Environmental Professional, as defined in RCNY § 43-1402(ar). I have primary direct responsibility for implementation of the Remedial Investigation for the Extell 551 Tenth Avenue Site, (NYC VCP Site No. **13CVCP104M**). I am responsible for the content of this Remedial Investigation Report (RIR), have reviewed its contents and certify that this RIR is accurate to the best of my knowledge and contains all available environmental information and data regarding the property.

Qualified Environmental Professional	Date	Signature
--------------------------------------	------	-----------

EXECUTIVE SUMMARY

The Remedial Investigation Report (RIR) provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy pursuant to RCNY§ 43-1407(f). The remedial investigation (RI) described in this document is consistent with applicable guidance.

Site Location and Current Usage

The Site is located at 547-551 Tenth Avenue in the Hell's Kitchen section of Manhattan, New York and is identified as Block 1069, Lots 29 and 34 on the New York City Tax Map. Following redevelopment, the Site will also occupy Block 1069, Lot 9136, which is an air volume lot over the west-adjacent property. Figure 1 shows the Site location. The Site comprises 17,528 square feet and is bounded by West 41st Street to the north, West 40th Street to the south, Tenth Avenue to the east, and the Church of Saints Cyril and Methodius and Saint Raphael to the west. A map of the Site boundary is included as Figure 2. Currently, the Site is a vacant parking lot with an unoccupied and dilapidated one-story structure formerly used as an automotive repair garage and gasoline filling station in the northwestern portion of the Site. An abandoned parking attendant structure is located in the southeastern portion of the Site. The majority of the Site is covered with broken asphalt and gravel.

Summary of Proposed Redevelopment Plan

The proposed future use of the Site will consist of a 52-story, approximately 727,000-gross square foot residential building with one sub-grade level that will include utility rooms (water supply, sewer, etc.), storage space, the superintendent's office, a management/leasing office and tenant amenities (game room, etc.) and ground-floor retail space. It is expected that the building will feature 380,000 square feet of market rate housing, 95,000 square feet of inclusionary housing, 93,000 square feet of community facility use, and 6,600 square feet of retail. The community facility, that is proposed to occupy the second through seventh floors of the building, has not yet been finalized. The proposed building footprint will occupy the entirety of the Site. The majority of the cellar level will be excavated to 13 feet below existing grade, with small pile cap areas excavated to a depth of 16 feet. The elevator pits located in the cellar level will be excavated to approximately 24 feet with small pile cap areas to a depth of 31 feet for these areas. Layout of the proposed site development is presented in Figure 3. The current zoning designation is C2-8, a zoning district in which residential, commercial, and community facilities

are allowed as-of-right. The proposed use is consistent with existing zoning for the property. Additional floor area ratio (FAR) is being sought for the development through an inclusionary housing bonus and a district improvement fund (DIF) bonus.

Summary of Past Uses of Site and Areas of Concern

Historic Sanborn fire insurance maps indicated that the Site was occupied by store-fronted dwellings from prior to 1890 to circa 1921, including a Chinese laundry noted on the 1911 and 1921 maps. An auto repair shop/filling station was noted on the northern portion of the Site on the 1950 through 2005 Sanborn maps, with four gasoline tanks shown on the 1950 through 1993 maps. The central and southern portions of the Site were vacant on the 1968 through 1985 maps, and an additional auto repair shop was noted on the central portion of the Site between 1990 and 2005. The southern portion of the Site was used as a parking lot between 1990 and 2005.

The Areas of Concern (AOCs) identified by investigations conducted at the Site include:

1. Site historical usage includes commercial laundry, automotive repair shop with hydraulic lifts, and a gasoline filling station.
2. Soil beneath the Site was observed to consist of fill material comprising sand and silt with concrete, gravel, brick, asphalt, wood, and ash to depths of approximately 10 to 16 feet below grade at the Site.
3. Active NYSDEC Spill No. 9503865 with bi-weekly product removal and monitoring.
4. Gasoline-contaminated soil and groundwater were identified in the vicinity of the former UST excavation area and automotive repair garage.
5. Petroleum product was observed in on-site monitor well MW-4 in the western portion of the Site and was reported to resemble No. 2 fuel oil.
6. An unknown reservoir suspected to be a waste oil pit was identified beneath the central portion of the automotive repair garage.

Summary of the Work Performed under the Remedial Investigation

Extell 4110 LLC performed the following scope of work in accordance with AKRF's December 2011 Remedial Investigation Work Plan (RIWP), which was approved by NYC OER:

1. Conducted a Site inspection to identify AOCs and physical obstructions (i.e., structures, buildings, etc.).
2. Conducted a Geophysical survey and test pit investigation to locate potential abandoned USTs or other buried structures, and to investigate the area beneath the hydraulic lifts in the former automotive repair garage to determine whether there were subsurface hydraulic tanks associated with the lifts.
3. Installed 13 soil borings across the entire project Site, and collected 23 soil samples for chemical analysis from the soil borings to evaluate soil quality.
4. Installed six temporary monitoring wells throughout the Site and sampled four existing on-Site groundwater monitoring wells throughout the Site to facilitate the collection of 10 groundwater samples for chemical analysis to evaluate groundwater quality.
5. Installed five soil vapor probes around the Site perimeter and collected five soil vapor samples for chemical analysis.

Summary of Environmental Findings

The following geologic and hydrogeologic conditions were noted by the Remedial Investigation at the Site:

1. Elevation of the Site is situated at an elevation of approximately 20 feet above the National Geodetic Vertical Datum of 1929 (an approximation of mean sea level).
2. Depth to groundwater ranges from 11 to 16 feet at the Site.
3. Based on previous investigations conducted by others at the Site including groundwater gauging and a tidal study, groundwater flow is to the north and northeast.
4. Depth to bedrock is approximately 30 feet below grade at the Site.
5. Soil beneath the Site was observed during the RI to consist of historic fill material comprising sand and silt with concrete, gravel, brick, asphalt, wood and ash to depths of approximately 12 feet below grade at the Site. A layer primarily consisting of brick and ash was identified at approximately 5 to 7 feet below grade in the central portion of the Site. Apparent native material, consisting of sand, silt, and fine gravel to cobbles was observed beneath the fill layer extending into the groundwater table to the boring

termination depths. A peat layer was previously encountered at the Site at a depth of approximately 27 feet below grade by others.

6. The Geophysical survey and test pit investigation identified several anomalies and buried debris including a suspected former UST excavation in the northwestern portion of the Site; former building foundations and drainage piping traversing the central portion of the Site; a concrete pad overlying a void space that had been filled with building debris in the central portion of the Site; and buried scrap metal and a buried boiler tank in the southern portion of the Site. An unknown reservoir suspected to be a waste oil pit located beneath the automotive repair garage was also identified during the survey.
7. Investigation of the unknown reservoir beneath the automotive repair building identified the presence of approximately 210 gallons of a petroleum/waste oil mixture, which was subsequently removed with a vacuum truck for off-site disposal.
8. Various petroleum-related VOCs were detected at low-level concentrations in several soil samples. One VOC, n-propylbenzene, was detected at a concentration exceeding the unrestricted use SCO. SVOCs including benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo(a,h)anthracene and indeno(1, 2, 3-cd)pyrene exceeded their unrestricted use as well as restricted residential SCOs, primarily in shallow and two deep soil samples. Metals including arsenic (16 ppm), barium (600 ppm), copper (210 ppm), lead (4,700 ppm), mercury (2 ppm), nickel (48 ppm) and zinc (1200 ppm) were detected above unrestricted use SCOs. Of these metals, arsenic, barium, copper, lead and mercury also exceeded restricted residential SCOs. Only one soil sample detected lead at a concentration of 4,700 ppm, all other lead concentrations were below 780 ppm. Three pesticides were detected exceeding unrestricted use SCOs; none of these exceeded restricted residential SCOs. PCBs were detected at trace levels.
9. Several petroleum and gasoline-related VOCs were detected exceeding their respective GQS. The highest detections of VOCs were identified within or in the vicinity of the automotive repair building. Chlorinated VOCs including trichloroethene (TCE), tetrachloroethene (PCE), 1, 1, 1-trichloroethane and carbon tetrachloride were detected at low level concentrations below the GQS. The SVOCs benzo(a)anthracene, naphthalene and chrysene were detected in groundwater at concentrations exceeding their GQS.

Metals including beryllium, chromium, iron, lead, magnesium, manganese, mercury, nickel and sodium were detected above GQS in unfiltered samples. Dissolved metal concentrations were significantly lower (with the exception of sodium). PCBs were not detected in groundwater. Three pesticides were detected in the groundwater at trace concentrations.

10. Several petroleum- related and chlorinated VOCs were detected in soil vapor samples. PCE was detected in all five soil vapor samples at concentrations ranging from 71.2 $\mu\text{g}/\text{m}^3$ to 161 $\mu\text{g}/\text{m}^3$. TCE was detected in two soil vapor samples at concentrations of 6.18 $\mu\text{g}/\text{m}^3$ and 10.7 $\mu\text{g}/\text{m}^3$.

REMEDIAL INVESTIGATION REPORT

1.0 SITE BACKGROUND

Extell 4110 LLC has enrolled in the New York City Voluntary Cleanup Program (NYC VCP) to investigate and remediate a 0.4-acre site located at 547-551 Tenth Avenue in the Hell's Kitchen section of Manhattan, New York. Mixed commercial, residential, and community based use is proposed for the property. The RI work has been ongoing since 1995 and the most recent investigation activities were performed between December 2011 and January 2012. Due to an open spill case with NYSDEC, (Spill # 9503865), monthly gauging of the on-site monitor wells has been performed since November 2011 and continues to date. This RIR summarizes the nature and extent of contamination and provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy that is protective of human health and the environment consistent with the use of the property pursuant to RCNY§ 43-1407(f).

1.1 SITE LOCATION AND CURRENT USAGE

The Site is located at 547-551 Tenth Avenue in the Hell's Kitchen section of Manhattan, New York and is identified as Block 1069, Lots 29 and 34 on the New York City Tax Map. Following redevelopment, the Site will also occupy Block 1069, Lot 9136, which is an air volume lot over the west-adjacent property. Figure 1 shows the Site location. The Site is 17,528 square feet and is bounded by West 41st Street to the north, West 40th Street to the south, Tenth Avenue to the east, and the Church of Saints Cyril and Methodius and Saint Raphael to the west. A map of the Site boundary is shown on Figure 2. Currently, the Site is a vacant parking lot and contains an unoccupied and dilapidated one-story structure formerly used as an automotive repair garage and gasoline filling station in the northwestern portion of the Site. An abandoned parking attendant structure is located in the southeastern portion of the Site. The majority of the Site is covered with broken asphalt and gravel.

1.2 PROPOSED REDEVELOPMENT PLAN

The proposed future use of the Site will consist of a 52-story, approximately 727,000-gross square foot residential building with one sub-grade level that will include utility rooms (water supply, sewer, etc.), storage space, the superintendent's office, a management/leasing office and tenant amenities (game room, etc.) and ground-floor retail space. It is expected that the building

will feature 380,000 square feet of market rate housing, 95,000 square feet of inclusionary housing, 93,000 square feet of community facility use, and 6,600 square feet of retail. The community facility, that is proposed to occupy the second through seventh floors of the building, has not yet been finalized. The proposed building footprint will occupy the entirety of the Site. The majority of the cellar level will be excavated to 13 feet below existing grade, with small pile cap areas excavated to a depth of 16 feet. The elevator pits located in the cellar level will be excavated to approximately 24 feet with small pile cap areas to a depth of 31 feet for these areas. Layout of the proposed Site development is presented in Figure 3. The current zoning designation is C2-8, a zoning district in which residential, commercial, and community facilities are allowed as-of-right. The proposed use is consistent with existing zoning for the property. Additional floor area ratio (FAR) is being sought for the development through an inclusionary housing bonus and a district improvement fund (DIF) bonus.

1.3 DESCRIPTION OF SURROUNDING PROPERTY

Properties adjacent to or in the vicinity of the Site include predominantly mixed use residential, commercial, and retail buildings. The Lincoln Tunnel approach ramps are located south and southwest of the Site, and subsurface railroad tracks, which support regional rail service running through New York Penn Station, are located west of the Site.

Figures 1 and 2 depict surrounding land usage.

2.0 SITE HISTORY

2.1 PAST USES AND OWNERSHIP

Historic Sanborn fire insurance maps indicated that the Site was occupied by store-fronted dwellings from prior to 1890 to circa 1921, including a Chinese laundry noted on the 1911 and 1921 maps. An auto repair shop/filling station was noted on the northern portion of the Site on the 1950 through 2005 Sanborn maps, with four gasoline tanks shown on the 1950 through 1993 maps. The central and southern portions of the Site were vacant on the 1968 through 1985 maps, and an additional auto repair shop was noted on the central portion of the Site between 1990 and 2005. The southern portion of the Site was used as a parking lot between 1990 and 2005.

2.2 PREVIOUS INVESTIGATIONS

Phase I Environmental Site Assessment, Parsons Brinckerhoff, June 2004

Parsons Brinckerhoff (PB) performed a Phase I ESA of the property in June 2004 for the Metropolitan Transportation Authority (MTA)/New York City Transit and the New York City Department of City Planning as part of the environmental studies for the Hudson Yards Rezoning and Development Program. Recognized Environmental Conditions (RECs) identified in this investigation included:

- The site was used historically as a laundry, a gas station, and an automobile repair garage.
- The New York Spills database identified the subject property in association with open Spill Case No. 9503865. The on-site spill was reported to the New York State Department of Environmental Conservation (NYSDEC) in June 1995 when on-site gasoline tanks were being removed. The spill report indicated that corrective action was taken, but apparently no closure report was ever submitted.

Phase II Environmental Site Investigation Report Site M, Parsons Brinckerhoff, April 2006

PB performed a Phase II Environmental Site Investigation of the property in April 2006 for MTA/New York City Transit. Soil samples were collected from 10 boring locations spaced throughout the site. All soil samples were taken as composites over the complete depth of the boring. Boring depths ranged from 16 to 32 feet below grade. Groundwater samples were collected from three locations, one in the northwestern (temporary well point), one in the southwestern (temporary well point) and one in the central-eastern (permanent monitor well FD-303W) areas of the Site. Results of the investigation included:

- Pesticides were identified in shallow soil samples at three boring locations on the northern side of the Site.
- Petroleum odors and measurable photoionization detector (PID) readings were noted in soil from the four boring locations in the northern portion of the Site between 10 and 20 feet below grade. A slight petroleum odor was reported at one boring in the southern side of the Site.
- Historic fill covered the Site to depths of 10 to 16 feet. Some soil samples contained elevated levels of semivolatile organic compounds (SVOCs), mainly consisting of polycyclic aromatic hydrocarbons (PAHs) typical of historic fill material, which may contain ash or other wastes. Concentrations of some of these compounds exceeded NYSDEC Recommended Soil Cleanup Objectives (RSCOs) (the guidelines used at that time). Soil samples from the historic fill material encountered at the Site also contained concentrations of some metals slightly above their respective RSCOs.
- Petroleum-related compounds were detected in groundwater samples from two locations in the north and the central portions of the Site.

Phase I Environmental Site Assessment, AESI, July 2010

Atlantic Environmental Solutions, Inc. (AESI) conducted a Phase I Environmental Site Assessment (ESA) of the project Site in July 2010 for Solil Management, LLC, the Site's owner at the time. At the time of the Site reconnaissance, the Site was occupied by an MTA construction yard, including the former automotive repair garage.

AESI's report summarized previous environmental reports including the 2006 Phase II Investigation prepared by PB for the MTA (discussed above) and related correspondences and other documentation regarding a UST removal effort at the Site in 1995. According to the report, in 1995, 8 USTs were excavated and disposed of off-site, along with 83 tons of contaminated soil and 434 gallons of contaminated water. At the time of the UST excavation and removal, a spill was reported to the NYSDEC, which was designated spill number 9503865. The soil and groundwater testing conducted at that time focused on the petroleum contamination identified in the spill area (area of the removed USTs) only. Soil and groundwater samples were collected from borings advanced to depths ranging from 15 to 30 feet below grade. Soil analytical results indicated elevated concentrations of SVOCs, pesticides and metals. Groundwater analytical results indicated elevated concentrations of benzene in excess of drinking water standards.

On-site Recognized Environmental Conditions (RECs) identified in the 2010 Phase I ESA included: the Site's E designation; the open spill from the 1995 tank removals; a possible

additional UST remaining at the Site identified through an in-person interview of Site representatives at that time; soil and groundwater contamination noted in the 2006 Phase II report; hydraulic lifts located within the service area of the former auto repair shop; and drums and containers of compressor lubricant and kerosene, gas cylinders and a dumpster located on-site.

In the 2010 Phase I ESA, AESI recommended a testing protocol and remediation, where appropriate, to satisfy the E designation and a delineation of petroleum contamination (including the former tank area and hydraulic lift area) to address the spill with the open spill case. AESI also recommended a ground penetrating radar (GPR) survey to determine whether there was a remaining UST at the Site and removal and proper disposal of the drums, containers of petroleum products, gas cylinders and the dumpster noted on-site.

Summary Investigation Report, Hydraulic Lift Investigation, Former Auto Shop, 547-551 10th Avenue, New York, NY, AESI, October 2010

In accordance with a request from NYSDEC in a letter dated September 3, 2010, AESI completed an investigation of the hydraulic lifts at the Site in October 2010. The investigation consisted of four soil borings advanced around the two hydraulic lifts located in the former auto repair garage. Although petroleum contamination was not reported in the soil samples collected from these borings, groundwater collected from temporary wells installed in the borings contained benzene, ethylbenzene, toluene, and xylenes (BTEX) compounds in excess of drinking water standards. AESI recommended no further actions for soil in this area, however, they recommended removal of the hydraulic lifts. AESI also recommended installation of a groundwater monitor well adjacent to the automotive repair building to further evaluate groundwater conditions at the Site.

Summary Investigation Report of the Former UST System (NYSDEC Spill Case 9503865), AESI, March 2011

AESI's report attachments included:

- An August 9, 2010 cover letter from AESI to NYSDEC for submission of their July 2010 Phase I ESA.
- A September 2010 letter from NYSDEC to Sol Goldman Investments, L.L.C. % Solil Management Corp. regarding review of the Phase I ESA report. NYSDEC requested submission of a scaled site map, a description of possible soil contamination in the area of the hydraulic lifts, and delineation of soil and groundwater contamination and installation of monitoring wells around the former gasoline tank system.

- An October 13, 2010 Subsurface Investigation Work Plan submitted by AESI to NYSDEC for a subsurface investigation of soil and groundwater in the area of the former USTs. The fieldwork was scheduled to be conducted in November 2010, with the Remedial Investigation Report to be submitted in December 2010.

The report detailed the field work conducted in January 2011 that included three soil borings in the former UST system area east of the former auto repair shop on the northern portion of the Site (MW-1 through MW-3) and one boring south of the former auto repair shop (MW-4), in accordance with NYSDEC's September 2010 request. The borings were advanced to 27 feet below grade, where an organic/peat layer was identified. Each of the four borings was retrofitted with monitor wells to a depth of 25 feet, with 15 feet of screen and 10 feet of casing. Groundwater was encountered between 13-13.5 feet below grade. The wells were surveyed to enable a groundwater flow direction across the Site, which was determined to be north/northeast across the northern portion of the Site.

Soil analytical results identified elevated concentrations of volatile organic compounds (VOCs) and SVOCs. The SVOCs were reported to be consistent with historic fill materials noted at the Site, and not likely indicative of a discharge; however, benzene, ethylbenzene and total xylenes were noted that were indicative of a gasoline discharge. Groundwater analysis detected gasoline components, including methyl tert butyl ether (MTBE), benzene, ethylbenzene and total xylenes, also indicative of a gasoline release.

AESI recommended no further investigation for the SVOCs detected on-site, however, additional investigation was recommended to delineate the extent of the VOC-related soil and groundwater contamination prior to defining a remediation strategy.

Groundwater Monitoring Report, 547-551 10th Avenue, New York, NY, AESI, July 2011

A tidal survey, detailed in an AESI report dated July 29, 2011, was conducted, as requested by NYSDEC in a letter dated April 22, 2011. Based on pressure transducers installed in three of the four on-site monitor wells for two tidal cycles over a 24-hour period, there was little to no tidal effect on the on-site monitor wells. Groundwater was shown to flow in a north-northeast direction across the northern half of the Site. The well not included in the survey (MW-4) contained free phase product, which was determined to closely approximate No. 2 fuel oil. Laboratory analysis of the three on-site monitor wells that did not have free phase product contained typical gasoline constituents BTEX and MTBE above groundwater standards; however, AESI noted that these concentrations, with the exception of a slight increase of benzene in MW-2, were lower than the previous January 2011 sampling event.

Well Gauging Report, AESI, October 31, 2011

Upon request from NYSDEC, AESI conducted well gauging of the four on-site monitor wells

previously installed by AESI and vacuum-enhanced fluid recovery (EFR) at monitor well MW-4. The product removal from monitoring well MW-4 was conducted in conjunction with the bi-weekly gauging activities, as requested by the NYSDEC spill case manager.

The gauging events, beginning on August 16, 2011, measured the depth to water in each of the four monitor wells, the depth to product in monitor well MW-4 (free phase product had not been detected in any of the other wells), reported photoionization detector (PID) readings in the wells and noted the volume of petroleum-contaminated water extracted for off-site disposal. A product thickness of 0.4 feet was reported and 362 gallons of petroleum-contaminated water were removed from the well for off-site disposal during the first well gauging. The next well gauging conducted on August 30, 2011 detected a product thickness of 0.5 feet in MW-4. During the September 12, 2011 event, where 0.6 feet of product was measured at MW-4, 2,370 gallons of petroleum-contaminated water were pumped out for off-site disposal. The October 11, 2011 gauging event yielded a measurement of 0.3 feet of free phase product and the October 28, 2011 event yielded product thickness measurement of 0.4 feet. A total of 942 gallons of oil/water mixture was removed on October 28th for off-site disposal. AESI recommended continued gauging and stated that the product level appeared to be diminishing as a result of the vacuum extraction. As described in Section 4.0, these gauging events (in addition to those conducted subsequently by AKRF) are included in the Well Gauging Data table included in Appendix E.

2.3 SITE INSPECTION

Site inspections were performed under the direction of the Qualified Environmental Professional (QEP) during the completion of the RI in November and December 2011. Groundwater gauging and Site inspections have been performed on a monthly basis since November 2011. The findings of the Site inspections have been included throughout this RIR.

2.4 AREAS OF CONCERN

The AOCs identified during previous Phase I ESA inspections and subsequent subsurface investigation activities for this Site include:

1. Site historical usage includes a commercial laundry, an automotive repair shop with hydraulic lifts, and a gasoline filling station.
2. Soil beneath the Site was observed to consist of fill material comprising sand and silt with concrete, gravel, brick, asphalt, wood, and ash to depths of approximately 10 to 16 feet below grade.

3. Active NYSDEC Spill No. 9503865 with bi-weekly product removal and monitoring.
4. Gasoline-contaminated soil and groundwater were identified in the vicinity of the former UST excavation area and automotive repair garage.
5. Petroleum product was observed in on-site monitor well MW-4 in the western portion of the Site and was reported to resemble No. 2 fuel oil.
6. An unknown reservoir suspected to be a waste oil pit was identified beneath the central portion of the automotive repair garage.

3.0 PROJECT MANAGEMENT

3.1 PROJECT ORGANIZATION

The Qualified Environmental Profession (QEP) responsible for preparation of this RIR is Michelle Lapin, P.E.

3.2 HEALTH AND SAFETY

All work described in this RIR was performed in full compliance with applicable laws and regulations, including Site and OSHA worker safety requirements and HAZWOPER requirements.

3.3 MATERIALS MANAGEMENT

All material encountered during the RI was managed in accordance with applicable laws and regulations.

4.0 REMEDIAL INVESTIGATION ACTIVITIES

Extell 4110 LLC performed the following scope of work in accordance with AKRF's December 2011 Remedial Investigation Work Plan (RIWP), which was approved by NYC OER:

1. Conducted a Site inspection to identify AOCs and physical obstructions (i.e., structures, buildings, etc.).
2. Conducted a Geophysical survey and test pit investigation to locate potential abandoned USTs or other buried structures, and to investigate the area beneath the hydraulic lifts in the former automotive repair garage to determine whether there were subsurface hydraulic tanks associated with the lifts.
3. Installed 13 soil borings across the entire project Site, and collected 23 soil samples for chemical analysis from the soil borings to evaluate soil quality.
4. Installed six temporary monitoring wells throughout the Site and sampled four existing on-site groundwater monitoring wells throughout the Site to facilitate the collection of ten groundwater samples for chemical analysis to evaluate groundwater quality.
5. Installed five soil vapor probes around Site perimeter and collected five soil vapor samples for chemical analysis.

4.1 GEOPHYSICAL INVESTIGATION AND RESULTS

A geophysical survey was performed on December 14, 2011 by Enviroprobe Service Inc. (Enviroprobe) of Moorestown, New Jersey to locate potential abandoned USTs or other buried structures, and to investigate the area beneath the hydraulic lifts in the former auto garage to determine whether there were subsurface hydraulic tanks associated with the lifts. The investigation was conducted using a Sensors and Software N250Plus cart-mounted Ground Penetrating Radar (GPR) unit with a 250 MHz antenna, a Radiodetection 4000T3 multi-frequency transmitter, a Radiodetection 4000 receiver, and a Fisher TW-6 metallic locator. The Site was first screened using the GPR and Fisher TW-6 unit. If evidence of anomalies were observed, the Radiodetection locator was then used to determine whether the anomalies were

utilities or other large subsurface metal objects. Finally, GPR profiles were collected over each metal-detector anomaly and inspected for reflections that could be indicative of USTs.

Access for the geophysical investigation was limited by the former parking attendant booth in the southeastern portion of the Site and certain areas of the interior of the automotive repair garage that were damaged or inaccessible.

Due to surface conditions and the underlying subsurface (buried fill material) conditions encountered at the Site, the GPR signal penetration was estimated at approximately three feet below grade in the majority of the accessible survey area. Several anomalies were identified during the GPR Survey.

Two small square-shaped anomalies were identified in the southern portion of the Site approximately 15 feet from the southern property line. Approximately 30 feet north of these anomalies, a trench-shaped anomaly was identified in an east-west direction toward Tenth Avenue. Approximately 15 feet north of the trench-shaped anomaly, a large rectangular anomaly measuring approximately 15 feet long by 6 feet wide was identified in the central portion of the Site. A second trench-shaped anomaly was identified in an east-west direction approximately 20 feet north of the rectangular anomaly and 15 feet south of the automotive repair building. A square-shaped anomaly was identified immediately east of this trench-shaped anomaly. A small, square-shaped anomaly was also identified in the northeastern corner of the Site. In addition, the area immediately north of the automotive repair garage in the northwestern corner of the Site was identified to consist of reinforced concrete. In the center of the reinforced concrete, the survey identified a square-shaped anomaly indicative of a former excavation area. A vent pipe located near the western property line was traced to this excavation area during the survey, which indicated a possible former UST area.

Survey activities conducted in the interior of the automotive repair garage could not identify the hydraulic fluid reservoirs associated with the hydraulic lifts due to interference from the metallic legs of the lifts and the density and make up of the reinforced concrete floor within the building. During the survey, an unknown pipe which appeared to lead to a sub-slab reservoir was

identified beneath the central portion of the automotive repair garage. A Radiodetection receiver was attached to the metallic piping associated with this unknown reservoir, and a signal was maintained approximately six feet south of the piping inlet. Other sub-slab piping, including a suspected water line attached to a former pressure washer and piping associated with the former bathroom, were identified and marked out within the automotive repair garage. These piping runs could not be traced out of the building due to interference with the reinforced concrete slab in the vicinity of the hydraulic lifts.

Enviroprobe's Geophysical Survey Report is included in Appendix B and anomalies identified during the GPR Survey are depicted on Figure 2.

4.2 TEST PIT INVESTIGATION AND RESULTS

Following the geophysical survey, a test pit investigation was conducted at the Site on December 22, 2011 by Brookside Environmental (Brookside) of Copiague, New York to further investigate the identified anomalies. A Caterpillar 304CR mini excavator was operated by Brookside with oversight from AKRF. Soil encountered during the test pit investigation was screened in the field for VOCs with a Thermo 580B PID.

Test pits were excavated in all exterior, accessible anomaly locations identified by the GPR survey. Test pits were not conducted inside of the automotive repair garage. The descriptions of the test pit investigations below correlate with the anomalies identified in Section 4.1, beginning in the southern portion of the Site and moving toward the north.

The investigation of the southernmost square-shaped anomaly identified a suspected buried boiler tank. The metallic tank was buried three feet below grade, measured approximately nine feet long by three feet wide and was concave at one end. The tank was not removed during the investigation, but appeared to be situated in the ground at an angle and buried among former building debris. A green fibrous insulation was identified along the side of the tank during the

investigation. The insulation was collected and analyzed for asbestos. Results of the insulation sample confirmed that the insulation contained asbestos.

Investigation of the small, square-shaped anomaly immediately north of the boiler tank identified buried scrap metal at approximately two feet below grade.

The east-west trending trench-shaped anomaly in the south-central portion of the Site approximately 30 feet north of the boiler tank and scrap metal was identified as a buried former brick building foundation wall.

The large rectangular-shaped anomaly located in the central portion of the Site was identified as an eight inch-thick concrete pad overlying buried former building debris including bricks, wood, pulverized concrete, and ash. Test pits in the vicinity of this anomaly identified former building debris to termination depths of approximately six feet below grade.

The east-west trending trench-shaped anomaly located approximately 20 feet north of the concrete pad and buried building debris was identified as a buried former brick building foundation wall. Each of the brick foundation walls discovered beneath the Site extended to depths of at least five feet below grade. Due to strength limitations of the mini-excavator and the scope of the investigation, the termination points of the building foundation walls were not determined. A former metallic drain and a few feet of associated piping (square-shaped anomaly immediately east of the buried building foundation) were identified approximately six inches beneath the asphalt surface, immediately east of the buried building foundation wall located in the north-central portion of the Site.

Test pits attempted in the vicinity of the anomaly in the northeastern portion of the Site were unsuccessful due to the thickness of the asphalt in this area. A test pit was also attempted in the western portion of the Site (in the vicinity of SB-4 on Figure 2), however, due to the thickness of the concrete slab in this area, could not be completed.

No visual evidence of contamination (PID readings, staining or odors) was identified to depths of approximately six feet below grade in the vicinities of any of the anomalies explored during the

Test Pit Investigation. No additional USTs or buried metallic debris were identified during the test pit investigation.

4.3 INVESTIGATION OF UNKNOWN RESERVOIR

A limited investigation was conducted in an attempt to identify the size, placement, and former use of the unknown reservoir located beneath the central portion of automotive repair garage. Generally, it appeared as an uncovered, circular metallic opening that protruded just above the concrete floor of the garage with a diameter of approximately four inches. The mouth of the pipe extended approximately two feet beneath the floor until it opened into an approximately three - foot deep reservoir. The upper foot of the reservoir was empty void space and the bottom two feet were filled with a petroleum mixture. An approximately two-foot layer of silty sediment was encountered beneath the petroleum mixture, at which point the reservoir appeared to terminate at a depth of approximately five feet below the grade of the concrete floor slab. It could not be determined whether the reservoir contained a solid bottom.

A sample was collected from the petroleum mixture contained within the reservoir on December 14, 2011, which separated into two phases – one dark brown and one light green. The sample was submitted to the laboratory and each product was analyzed to identify the types of petroleum present. Results indicated that the reservoir contained a heavier degraded gasoline and waste oil mixture floating on top of a lighter-color, water-based lubricating oil or motor oil. A laboratory report associated with the product collected during the investigation of the reservoir is included in Appendix H.

On December 22, 2011, Envirowaste Oil Recovery of Mahopac, New York used a vacuum truck to remove approximately 210 gallons of the petroleum mixture from the reservoir. A small amount of residual oil remained at the bottom of the reservoir that could not be recovered due to the presence of various types of debris (light bulbs, plastic bottles, cans, and caps), which blocked the vacuum hose. During groundwater gauging events that have been conducted subsequent to the fluid recovery performed from the reservoir, the contents of the reservoir

appear to be unchanged - a small amount of unrecoverable residual oil remains. Due to the unknown contents, structural integrity and location of the reservoir beneath the former automotive repair building, it is suspected to have been used as a waste pit/tank. Disposal documentation for the petroleum mixture transported off-site is included in Appendix G.

4.4 BORINGS AND MONITOR WELLS

Drilling and Soil Logging

Fourteen soil borings (SB-1 through SB-11, SB-11A, SB-12, and SB-13) were advanced during the investigation on December 28 and 29, 2011 to characterize and field-screen subsurface materials by Zebra Environmental Corp. (Zebra) of Lynbrook, New York. The soil boring locations are depicted on Figure 2. The drilling and sampling was completed using a track-mounted direct push Geoprobe drill rig. All non-dedicated drilling and sampling equipment was decontaminated between borings. Each soil sample was logged and screened for organic vapors with a PID, calibrated at the start of each work day with 100 parts per million (ppm) isobutylene. Due to the presence of a peat layer at the Site, methane was also monitored during the investigation. A record of the encountered geologic characteristics and the PID screening results are included in the soil boring logs, which are attached as Appendix C.

As required by the RIWP, one soil sample was collected from a shallow interval between 0 and 5 feet below grade (depending on field conditions) and one soil sample was collected from the one foot interval above the water table or from the interval of greatest observed contamination based on field observations (odor and staining) or PID readings from nine borings. Five delineation soil borings were advanced in the vicinity of monitor well MW-4. Dedicated sampling gloves and sampling devices were used for sample collection.

Boring logs were prepared by a geologist and are attached in Appendix C. A map showing the location of soil borings and existing/temporary monitor wells is shown in Figure 2.

Groundwater Monitoring Well Construction

Groundwater samples were collected from temporary monitoring wells installed by Zebra in six of the soil borings (SB-1, SB-2, SB-4, SB-7, SB-8, and SB-9); no permanent wells were installed. Temporary monitoring wells were installed by inserting new, one-inch diameter PVC well screen to span the overburden groundwater aquifer within each boring and completed with riser above the groundwater interface in each open borehole. The annulus around the well screens was filled with clean, number two silica sand. Additionally, four existing monitoring wells (MW-1 through MW-4) were developed and sampled. Older well FD-303W was not sampled at this time due to the unsecured nature of the access manway to the well and the condition of the well cap and exposed PVC piping (the well had been compromised).

Monitor well locations are shown in Figure 2.

Surveying

All soil, groundwater, and soil vapor sampling locations established as part of the RI were collected immediately following the investigation activities with a Trimble Geo XH handheld GPS device and Geobeacon Receiver.

Water Level Measurement

Groundwater gauging was conducted by AKRF from each of the temporary monitoring wells installed during the RI. In addition, gauging of existing on-Site monitor wells MW-1 through MW-4, FD-303W, W1, W1-40, and W2 was completed on at least a monthly basis beginning on November 18, 2011. Due to the presence of free product previously identified in monitor well MW-4, an absorbent sock was added to the well on December 6, 2011. Gauging events subsequent to adding the absorbent sock to monitor well MW-4 have not identified any measurable free product. During each gauging event conducted following the initial insertion of the absorbent sock, the sock has been removed from the well and replaced with a new sock. Absorbent socks removed from monitor well MW-4 have shown approximately three to six

inches of an oily sheen absorbed into the hydrophobic material. A table displaying the gauging data and observations made during the gauging events is included as Appendix E.

4.3 SAMPLE COLLECTION AND CHEMICAL ANALYSIS

Sampling performed as part of the field investigation was conducted in accordance with the NYC OER-approved RIWP for all Areas of Concern and also considered other means for bias of sampling based on professional judgment, area history, discolored soil, stressed vegetation, drainage patterns, field instrument measurements, odor, or other field indicators. All media including soil, groundwater and soil vapor have been sampled and evaluated in the RIR. Discrete (grab) samples have been used for final delineation of the nature and extent of contamination and to determine the impact of contaminants on public health and the environment. The sampling performed and presented in this RIR provides sufficient basis for evaluation of remedial action alternatives, establishment of a qualitative human health exposure assessment, and selection of a final remedy.

Soil Sampling

Twenty three soil samples were collected for chemical analysis during this RI. Data on soil sample collection for chemical analyses, including dates of collection and sample depths, is reported in Tables 1 through 4. Figure 2 shows the location of samples collected in this investigation. Laboratories and analytical methods are discussed below.

Groundwater Sampling

Ten groundwater samples were collected for chemical analysis during this RI. Groundwater sample collection data is reported in Tables 5 through 8. Sampling logs with information on purging and sampling of groundwater monitor wells is included in Appendix D. Figure 2 shows the location of groundwater samples collected during this investigation. Laboratories and analytical methods are discussed below.

Soil Vapor Sampling

Five soil vapor probes were installed and five soil vapor samples were collected for chemical analysis during this RI. All sample locations were from the exterior areas of broken asphaltic surfaces at the Site (see Figure 2). The soil vapor sampling points were installed by Zebra by

using a direct-push probe (i.e., Geoprobe) system to advance a 0.75-inch diameter hollow probe rod fitted with an expendable 6-inch long stainless steel screened drive point to a depth of approximately nine feet below ground surface. Dedicated Teflon tubing with threaded fittings was connected to the probe. The hollow probe rod was then removed and the boring was backfilled with clean silica sand to one foot above the screen. Hydrated bentonite was used to fill the remaining void around the sampling tubing to ground surface.

Prior to sampling, each soil vapor point was purged of three sampler volumes using a peristaltic pump. During purging, an inverted one-gallon bucket was placed over the sampling point and helium gas was introduced through a small hole in the bucket to saturate the atmosphere around the sample port with helium gas. The purged vapors were collected into a Tedlar bag and monitored using a portable helium detector to check for short-circuiting of ambient air into the vapor sampling point and verify the adequacy of the bentonite seal. Helium concentrations of less than 10 percent were considered sufficient to verify a tight seal. All soil vapor points passed the seal integrity tests with helium readings ranging from not detected (ND) to 10 parts per million (ppm). Purged vapors were also field-screened for organic vapors using a PID. Soil vapor sample SG-4 exhibited a PID reading of 1.1 ppm. No other detections were recorded at the remaining sample locations. After purging, each probe was connected via Teflon tubing to a laboratory-supplied 6-liter SUMMA canister equipped with a 0.1 liter per minute (L/min) flow regulator. Soil vapor samples were collected in SUMMA canisters for an approximately 2-hour sampling period.

Soil vapor sampling locations are shown on Figure 2. Soil vapor sample collection data is reported in Table 9. Soil vapor sampling logs are included in Appendix F. Methodologies used for soil vapor assessment conform to the *NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006* and ASTM E 2600-08 “Standard Practice for Assessment of Vapor Intrusion into Structures on Property Involved in Real Estate Transactions”.

Chemical Analysis

Chemical analytical work presented in this RIR has been performed in the following manner:

Factor	Description
Quality Assurance Officer	The chemical analytical quality assurance is directed by Dustin Kapson of AKRF, Inc.
Chemical Analytical Laboratory	Chemical analytical laboratories used in the RI are NYS ELAP certified and were Alpha Analytical Laboratories of Westborough, Massachusetts (Soil and Groundwater) and Mansfield,

Chemical Analytical Methods	<p>Massachusetts (Soil Vapor).</p> <p>Soil analytical methods:</p> <ul style="list-style-type: none"> • TAL Metals by EPA Method 6010C (rev. 2007); • VOCs by EPA Method 8260C (rev. 2006); • SVOCs by EPA Method 8270D (rev. 2007); • Pesticides by EPA Method 8081B (rev. 2000); • PCBs by EPA Method 8082A (rev. 2000). <p>Groundwater analytical methods:</p> <ul style="list-style-type: none"> • TAL Metals by EPA Method 6010C (rev. 2007); • VOCs by EPA Method 8260C (rev. 2006); • SVOCs by EPA Method 8270D (rev. 2007); • Pesticides by EPA Method 8081B (rev. 2000); • PCBs by EPA Method 8082A (rev. 2000). <p>Soil vapor analytical methods:</p> <ul style="list-style-type: none"> • VOCs by EPA Method TO-15 for VOCs.
-----------------------------	--

Quality Assurance/Quality Control Sampling

For quality assurance/quality control (QA/QC) purposes, one trip blank was sent with the collected soil samples (TB-S) and one trip blank was sent with the collected groundwater samples (TB-W) for laboratory analysis. The trip blanks were analyzed for VOCs by EPA Method 8260 to check for contamination during transport and sampling procedures. None of the analytical compounds were detected in either of the trip blanks.

Results of Chemical Analyses

Laboratory data for soil, groundwater and soil vapor are summarized in Tables 1 through 9. Laboratory data deliverables for all samples evaluated in this RIR are provided in digital form in Appendix H.

5.0 ENVIRONMENTAL EVALUATION

5.1 GEOLOGICAL AND HYDROGEOLOGICAL CONDITIONS

Stratigraphy

Organic vapors were detected with the PID at concentrations exceeding background conditions in borings SB-5, SB-7, SB-8, SB-9, SB-11, SB-11A and SB-13 located in the central to northeastern portions of the Site. PID concentrations ranging from 2.5 ppm to 74.7 ppm were detected in these borings, with the highest detections observed between depths of 13 to 15 feet below grade in boring SB-11 advanced immediately west of monitor well MW-4 and boring SB-8 advanced in the northeastern portion of the Site. Petroleum-like odors were observed at similar depths (13 to 15 feet) within SB-11 and SB-11A. Gasoline-like odors were observed at similar depths above and in the vicinity of the groundwater table in borings SB-6, SB-7 and SB-8. A mixed petroleum and gasoline-like odor was identified in boring SB-9. Petroleum odors were identified in groundwater sampled from each of the monitor wells (MW-1 through MW-4) and from temporary wells TW-7, TW-8, and TW-9. A petroleum sheen was identified on the water table at temporary well TW-9. Petroleum contamination was not identified in soil below the groundwater table. Organic vapors were not detected with the PID in the remaining borings or samples. Methane concentrations were not detected above background conditions during the investigation. Soil descriptions, observations, and PID readings were recorded on the soil boring logs provided in Appendix C.

Historic fill material, consisting of sand, with silt, fine gravel, brick, ash, concrete, and asphalt was present to depths of approximately 12 feet below grade in most borings and extended to approximately 15 feet below grade in the northeastern portion of the Site. A layer primarily consisting of brick and ash was identified at approximately 5 to 7 feet below grade in the central portion of the Site. Apparent native material, consisting of sand, silt, and fine gravel to cobbles was observed beneath the fill layer extending into the groundwater table to the boring termination depths. Groundwater was encountered between 13 and 16 feet below grade during the drilling activities.

Geoprobe refusal was encountered in boring SB-8 located in the northeastern portion of the Site at approximately 15 feet below grade due to suspected cobbles. An approximately one-foot thick

piece of wood was encountered in this boring from 12 to 13 feet below grade. Geoprobe refusal was also encountered in the area in the vicinity of monitor well MW-4, approximately 20 feet south of the automotive repair garage. Refusal occurred on suspected cobbles or boulders at depths ranging from 12 to 15 feet in borings SB-10, SB-11A, SB-12, and SB-13. U.S. Geological Survey reports indicate that bedrock beneath the site is expected at a depth of approximately 30 feet below grade.

Hydrogeology

A table of water level data for all monitor wells is included in Appendix E. The average depth to groundwater is approximately 13.5 feet below grade and the range in depth is approximately 11 feet below grade to 16 feet below grade. Based on previous investigations conducted by others at the Site, including groundwater gauging and a tidal study, groundwater flow is to the north and northeast. Groundwater flow direction can be affected by many factors, including past filling activities, underground utilities and other subsurface features such as subway lines, basements, and bedrock geology. Dewatering activities associated with nearby construction projects or the subway/railroad lines can also affect groundwater flow direction. Groundwater in Manhattan is not used as a source of potable water.

5.2 SOIL CHEMISTRY

Two primary soil samples were collected for characterization purposes from borings SB-1 through SB-9. Five delineation soil borings (SB-11, and SB-11A through SB-13) were advanced in the vicinity of monitor well MW-4. Soil sample analytical results were compared to the NYSDEC Unrestricted Use Soil Cleanup Objectives (UUSCOs) listed in 6 NYCRR Subpart 375, Part 375 Soil Cleanup Objectives for Restricted – Residential Use (RSCOs), and Part 375 Soil Cleanup Objective for the Protection of Groundwater (GWSCOs).

Volatile Organic Compounds in Soil

The petroleum-related compound n-propylbenzene was detected in soil sample SB-11(14-15) at a concentration of 6.1 ppm, exceeding the NYSDEC UUSCO of 3.9 ppm. This concentration does not exceed the NYSDEC RSCO. N-propylbenzene was also detected in four other soil

samples [including SB-11A(14-15)]; however, these detections ranged from 0.003 ppm to 0.49 ppm and did not exceed the NYSDEC UUSCO or RSCO.

Various other petroleum-related compounds including 1,2,4,5-tetramethylbenzene, 1,2,4-trimethylbenzene, isopropylbenzene, 1,4-diethylbenzene, 4-ethyltoluene, naphthalene, n-butylbenzene, xylenes, p-isopropyltoluene, sec-butylbenzene, and/or tert-butylbenzene were detected at low-level concentrations in several soil samples. None of these petroleum-related detections exceeded respective NYSDEC UUSCOs or RSCOs. The majority of these detections were identified in the soil samples collected immediately above the groundwater table.

1,2-dichloroethane (1,2-DCA) was detected in twelve soil samples ranging from a concentration of 0.0024 ppm to 0.0093 ppm. None of these concentrations exceeded the UUSCO of 0.02 ppm.

It should be noted that, due to a dilution factor of 40 used in soil samples SB-5(4-5), SB-8(14-15), SB-9(14-15), SB-11(14-15) and SB-11A(14-15), select reporting limits (as shown on Table 1) were elevated due to elevated concentrations of target and non-target compounds, which prohibited laboratory instruments from analyzing at or below NYSDEC UUSCOs for some compounds. Soil sample results for VOCs are listed in Table 1.

Semivolatile Organic Compounds in Soil

SVOCs were detected in 20 of the 23 three soil samples analyzed. Polycyclic aromatic hydrocarbons (PAHs) including benzo[a]anthracene (28 ppm), benzo[a]pyrene (26 PPM), benzo[b]fluoranthene (24 ppm), benzo[k]fluoranthene (26 ppm), chrysene (27 ppm), dibenzo(a,h)anthracene (6.6 ppm), and indeno[1,2,3-cd]pyrene (13 ppm) exceeded their respective NYSDEC UUSCOs in up to seven samples. Five soil samples SB-5(2-3), SB-6(1-2), SB-8(4-5), SB-11A (14-15), and SB-12(11-12) exhibited PAHs (including benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo [k]fluoranthene, chrysene, dibenzo(a,h)anthracene, and/or indeno[1,2,3-cd]pyrene) concentrations exceeding NYSDEC RSCOs. The SVOC 2-methylnaphthalene was detected in four soil samples at concentrations ranging from 0.5 ppm to 1.2 ppm, which slightly exceed the NYSDEC RSCO of 0.41 ppm. With the exception of the exceedances of the UUSCOs/RSCOs detected in soil samples SB-11A(14-15) and SB-12(11-12),

PAH exceedances were identified within shallow soils well above the groundwater table. These detections may be attributed to historic fill material at the Site. Soil sample results for SVOCs are listed in Table 2.

Metals in Soil

A review of the analytical results indicates that 22 of the 23 metals analyzed were detected in one or more of the 18 soil samples analyzed. Arsenic was detected in soil sample SB-5(2-3) at a concentration of 16 ppm, slightly exceeding the NYSDEC UUSCO of 13 ppm. This concentration does not exceed the NYSDEC RSCO.

Barium was detected in three soil samples [SB-3(1-2), SB-5(2-3) and SB-8(4-5)] at a maximum concentration of 600 ppm, exceeding Track 1 Unrestricted Use and Restricted Residential SCOs.

Copper was detected in three soil samples [SB-2(0-1), SB-3(1-2), and SB-5(2-3)] at a maximum concentration of 210 ppm, exceeding both Unrestricted and Restricted Residential Use SCOs.

Lead was detected in 13 soil samples at concentrations ranging from 38 ppm to 4,700 ppm, exceeding the Restricted Residential SCO. One soil sample, SB-8(4-5), exhibited lead at a concentration of 4,700 ppm; all other lead concentrations were below 780 ppm.

Mercury was detected in 12 of the 18 soil samples at a maximum concentration of 2 ppm, exceeding Unrestricted Use and Restricted Residential Use SCOs.

Nickel was detected in soil sample SB-1(3-4) at a concentration of 350 ppm, which exceeds both the Unrestricted Use SCO of 30 ppm and the Restricted Residential Use SCO of 140 ppm. Nickel was also detected in soil sample SB-3(1-2) at a concentration of 48 ppm, exceeding the NYSDEC UUSCO of 30 mg/kg.

Zinc was detected in 7 of the 18 soil samples at a maximum concentration of 1,200 ppm, exceeding the Unrestricted Use SCO.

In the absence of other indications of contamination at the Site, these metals do not appear indicative of a release at the Site, can be attributable to historic fill materials, and are not constituents of concern for this investigation. Soil sample results for metals are listed in Table 3.

Polychlorinated Biphenyls and Pesticides in Soil

A review of the laboratory analytical results indicates that the PCB Aroclor 1260 was detected in two soil samples, at an estimated concentration of 0.0202 ppm in soil sample SB-3(1-2) and an estimated concentration of 0.018 ppm in soil sample SB-5(2-3). Both of these detected concentrations are below the NYSDEC UUSCO of 0.1 ppm.

Pesticides were detected in 6 of the 18 soil samples analyzed at concentrations exceeding NYSDEC UUSCOs. Pesticides detected in exceedance of UUSCOs included 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, and chlordane. None of these detections exceeded their respective Restricted Residential SCOs. Soil sample results for PCBs and pesticides are listed in Table 4.

Data collected during the RI is sufficient to delineate the vertical and horizontal distribution of contaminants in soil/fill at the Site. Summary data tables for chemical analyses performed on soil samples are included in Tables 1 through 4.

5.3 GROUNDWATER CHEMISTRY

The six temporary monitor wells TW-1, TW-2, TW-4, TW-7, TW-8, and TW-9 and four existing monitor wells MW-1 through MW-4 were gauged, purged, and sampled in accordance with the NYC OER-approved RIWP. Groundwater sample analytical results were compared to the NYSDEC Class GA Ambient Water Quality Standards (GQS).

Volatile Organic Compounds in Groundwater

VOCs were detected in all but one (TW-1) groundwater samples collected during the investigation. Groundwater samples collected in the southern and west-central portion of the Site did not exhibit exceedances of GQS. Several petroleum- and gasoline-related VOCs were detected exceeding their respective GQS located within or in the vicinity of the former automotive repair building.

The highest detections of VOCs were identified within the automotive repair building in close proximity to the southern hydraulic lift. Ethylbenzene was detected in groundwater sample TW-

9 at a concentration of 1,400 micrograms per liter ($\mu\text{g/l}$) (the GQS is 5 $\mu\text{g/l}$) and benzene was detected at a concentration of 280 $\mu\text{g/l}$ (the GQS is 1 $\mu\text{g/l}$). Other petroleum- and gasoline-related VOCs detected above their respective GQS in groundwater sample TW-9 include 1,2,4,5-tetramethylbenzene, 1,3,5-trimethylbenzene, isopropylbenzene, n-butylbenzene, n-propylbenzene, naphthalene, toluene and xylenes. In addition, the plastic-related VOC acrylonitrile was detected at an elevated concentration above its GQS in groundwater sample TW-9.

Groundwater sample TW-7 exhibited concentrations of 1,2,4,5-tetramethylbenzene, benzene, isopropylbenzene, and n-propylbenzene exceeding their respective GQS. Groundwater sample TW-8 exhibited only MTBE at a concentration exceeding its GQS.

Detections of gasoline-related VOCs identified in monitor wells MW-1 through MW-3 were similar to the previous sampling event conducted in June 2011 with the highest concentrations identified in monitor well MW-1 (benzene concentration of 40 $\mu\text{g/l}$). No non-aqueous phase liquid (NAPL) was identified in monitor well MW-4 during the sampling event. Therefore, monitor well MW-4 was also sampled at this time. The groundwater sample collected from monitor well MW-4 also exhibited similar gasoline-related VOCs at slightly lower concentrations. Gasoline-related VOCs that were detected in at least one of the wells at concentrations exceeding their respective GQS included 1,2,4,5-tetramethylbenzene, benzene, ethylbenzene, isopropylbenzene, n-butylbenzene, n-propylbenzene, and sec-butylbenzene.

The VOC trichloroethene (TCE) was detected at low level concentrations below the GQS of 5 $\mu\text{g/l}$ in the groundwater samples collected from monitor wells MW-1 through MW-4. Groundwater sample results for VOCs are listed in Table 5.

Semivolatile Organic Compounds in Groundwater

SVOCs were detected in each of the groundwater samples collected during the investigation (including all temporary and permanent monitor wells sampled). The SVOCs benzo(a)anthracene and chrysene were both detected at estimated concentrations of 0.08 $\mu\text{g/l}$ in groundwater sample MW-3, which exceed the GQS of 0.002 $\mu\text{g/l}$ for both compounds. These

compounds are most likely attributable to historic fill material at the Site and are not indicative of a release. No other SVOCs were detected at concentrations exceeding their respective GQS. Groundwater sample results for SVOCs are listed in Table 6.

Metals in Groundwater

Metals were detected in both the unfiltered and filtered samples, with concentrations of nine metals (beryllium, chromium, iron, lead, magnesium, manganese, mercury, nickel and sodium) exceeding their respective GQS in one to ten unfiltered groundwater samples. Concentrations in the filtered samples were significantly lower (with the exception of sodium), with beryllium, iron, magnesium, manganese, and sodium exceeding their respective GQS in one to ten samples. Lead was detected in unfiltered samples at concentrations ranging from 14 to 155 $\mu\text{g/l}$, and in filtered samples at concentrations below the GQS ranging from an estimated concentration of 3 to 23 $\mu\text{g/l}$ (the GQS for lead is 25 $\mu\text{g/l}$). Four metals detected in the unfiltered samples (chromium, lead, mercury and nickel) were not detected in the filtered samples. The analytical results suggest that the higher metals concentrations in the unfiltered samples were primarily due to suspended sediments entrained in the collected samples. Groundwater sample results for metals are listed in Table 7.

Polychlorinated Biphenyls and Pesticides in Groundwater

A review of the laboratory analytical results indicates that no PCBs were detected at concentrations exceeding laboratory reporting limits for any of the groundwater samples.

Three pesticides were detected in the groundwater samples analyzed. The pesticide heptachlor epoxide was detected in groundwater sample MW-1 at an estimated concentration of 0.016 $\mu\text{g/l}$, which is below its GQS of 0.03 $\mu\text{g/l}$. The pesticide endosulfan II was detected in groundwater sample MW-2 at an estimated concentration of 0.016 $\mu\text{g/l}$. Endosulfan II does not have an established GQS. The pesticide endosulfan I was detected in groundwater sample MW-4 at a concentration of 0.071 $\mu\text{g/l}$. Endosulfan I does not have an established GQS. No other pesticides were detected in the groundwater samples. The pesticides detected in groundwater

were not detected in on-site soils. Groundwater sample results for PCBs and pesticides are listed in Table 8.

Data collected during the RI is sufficient to delineate the distribution of contaminants in groundwater at the Site. Summary data tables for chemical analyses performed on groundwater samples are included in Tables 5 through 8. Exceedances of applicable groundwater standards are shown.

5.4 SOIL VAPOR CHEMISTRY

Analytical results for soil vapor samples collected from beneath exterior asphaltic surfaces at the Site were compared to the NYSDOH Air Guideline Values (AGVs) of the Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York, dated October 2006. AGVs are intended as a reference for indoor air quality and are not directly applicable to soil vapor sample results. A review of the soil vapor sample analytical results indicated that 31 of the 64 VOCs analyzed utilizing EPA Method TO-15 were detected in one or more of the samples. The NYSDOH has established AGVs for three of the VOCs analyzed [methylene chloride, tetrachloroethene (PCE), and trichloroethene (TCE)]. PCE was detected in all five soil vapor samples at concentrations ranging from 71.2 $\mu\text{g}/\text{m}^3$ to 161 $\mu\text{g}/\text{m}^3$. Four of the five soil vapor samples exhibited PCE at concentrations greater than the AGV of 100 $\mu\text{g}/\text{m}^3$. TCE was detected in soil vapor sample SG-2 at a concentration of 6.18 $\mu\text{g}/\text{m}^3$ which is greater than the AGV of 5 $\mu\text{g}/\text{m}^3$. Methylene chloride was detected below laboratory detection limits in all of the soil vapor samples analyzed.

The compounds that were detected during the sub-slab soil vapor sampling are a combination of chlorinated solvents and gasoline/petroleum-related constituents. Field or analytical evidence of an on-site source area for chlorinated solvent contamination was not identified during the RI activities; however, residual contamination associated with the former gasoline filling station and automotive repair facility was identified and may have contributed to these results. Overall, the results indicate a need for remedial action to address the potential for intrusion of soil vapors into occupied structures built onsite.

Analytical results for sub-slab soil vapor samples are presented in Table 9.

Data collected during the RI is sufficient to delineate the distribution of contaminants in soil vapor at the Site based on the proposed redevelopment. A summary table of data for chemical analyses performed on soil vapor samples is included in Table 9.

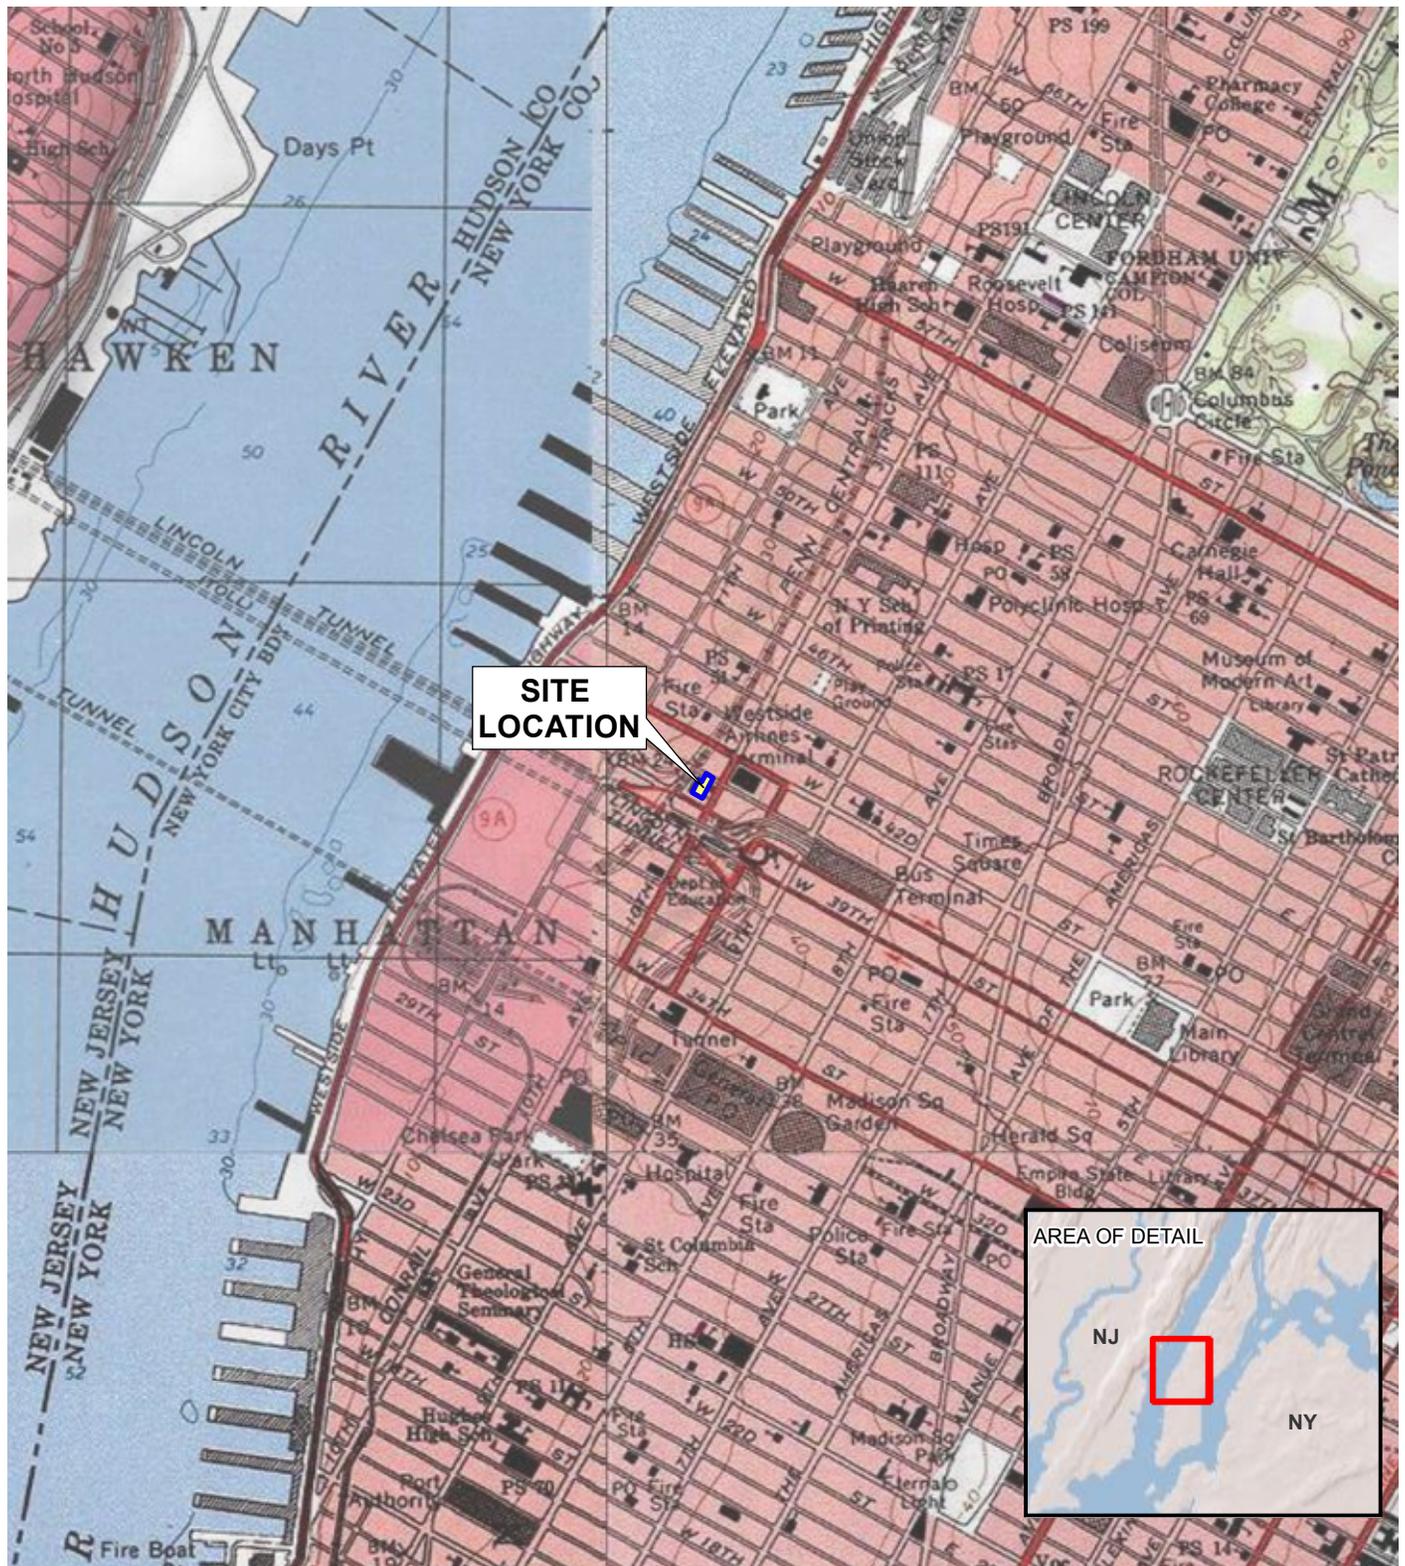

5.5 PRIOR ACTIVITY

Based on an evaluation of the data and information from the RIR, disposal of significant amounts of hazardous waste is not suspected at this site.

5.6 IMPEDIMENTS TO REMEDIAL ACTION

There are no known impediments to remedial action at this property.

Soil, Groundwater & Soil Vapor Analytical Results
Notes

GENERAL

- NS** : No soil cleanup objective listed.
- ND** : Not detected.
- NA** : Not analyzed.
- U** : The analyte was not detected at the indicated concentration.
- J** : The concentration given is an estimated value.

Soil Exceedences marked by Part 375 Unrestricted SCOs are highlighted in bold font.
Soil Exceedences marked by Part 375 Restricted SCOs are shaded.

SOIL

Part 375 Soil Cleanup Objectives : Soil Clean-up Objectives listed in NYSDEC (New York State Department of Environmental Conservation) "Part 375" Regulations (6 NYCRR Part 375).

mg/kg : milligrams per kilogram = parts per million (ppm)

GW exceedences of Class GA Ambient Water Quality Standards are marked in bold font.

GROUNDWATER

NYSDEC Class GA Ambient Standard : New York State Department of Environmental Conservation Technical and Operational Guidance Series (1.1.1): Class GA Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations.

µg/L : micrograms per Liter = parts per billion (ppb)

SOIL VAPOR

µg/m³ : micrograms per cubic meter of air

NYSDOH 2003 Soil Vapor Indoor Upper Fence : Upper fence indoor air values from "Table C1. NYSDOH 2003: Study of Volatile Organic Chemicals in Air of Fuel Oil Heated Homes", published in the NYSDOH Soil Vapor Intrusion Guidance Document, Appendix C" (October 2006).

EPA 2001 BASE 90th percentile : 90th Percentile indoor air values from "Table C-2. EPA 2001: Building Assessment and Survey Evaluation (BASE) Database, SUMMA canister method", published in the NYSDOH Soil Vapor Intrusion Guidance Document, Appendix C" (October 2006).

NYSDOH Soil Vapor Intrusion Air Guidance Value : NYSDOH Air Guideline Values (AGVs) presented in the Final Guidance for Evaluating Soil Vapor Intrusion in the State of New York, dated October 2006 ("NYSDOH Vapor Intrusion Guidance Document").

Phase I Environmental Site Assessment Block 1069, Lots 29 and 34

537- 547 Tenth Avenue New York, New York

June 9, 2004

Revision Number 0.2
CIN Number 1783

For:

New York City
Department of City Planning 

Submitted by:

In association with:

The Louis Berger Group, Inc.

EXECUTIVE SUMMARY

At the request of the City of New York (the City), the Parsons Brinckerhoff (PB) Team conducted a Phase I Environmental Site Assessment (ESA) of the property located at 537-547 Tenth Avenue, New York, New York (Block 1069 Lots 29 and 34, hereafter referred to as the "Subject Property"). The purpose of this ESA is to identify, to the extent feasible, the presence or likely presence of hazardous substances or petroleum products on or near the Subject Property.

These hazardous substances and petroleum products are defined in the American Society of Testing and Materials (ASTM) Standard Practice E 1527-00 as *recognized environmental conditions (RECs)*. In addition, other environmental issues and conditions not considered to be RECs are identified in this assessment. These include *historical RECs* or *de minimis* conditions.

The Phase I ESA also includes a preliminary evaluation of specific potential environmental issues or conditions that are, according to ASTM E 1527-00, considered non-scope considerations. These issues include radon, asbestos-containing materials, lead-based paint, and polychlorinated biphenyls. The Phase I ESA includes a review of regulatory agency databases and historical maps, and visual observations of the Subject Property and adjoining properties.

The City has requested that this assessment be conducted for purposes of environmental due diligence in order to qualify for the innocent landowner defense to CERCLA liability. In addition, the assessment is intended to identify conditions that have the potential to impact the use of the Subject Property as part of the No. 7 Subway Extension in conjunction with the Hudson Yards Rezoning and Development Program.

The Subject Property consists of an approximately 17,875-square foot rectangular-shaped parcel located on the west side of Tenth Avenue, between West 40th and West 41st Streets, in an area that is primarily characterized by commercial uses. Review of historical Sanborn Fire Insurance Maps identified RECs associated with historical uses of the Subject Property and adjoining properties. These historical RECs include a "Chinese Laundry", a gas station and an automobile repair garage at the Subject Property, and a coal yard, a piano factory and several gas stations at adjoining properties.

Review of regulatory agency databases identified the Subject Property, as well as two nearby facilities, as active New York Spills/Leaking Underground Storage Tanks (NY Spills/LTANKS) cases that are considered RECs.

Based on the findings of this Phase I ESA, the identified RECs would not preclude use of the Subject Property as part of the Hudson Yards Rezoning and Development Program in conjunction with the proposed extension of the No. 7 Subway Extension; however, prior to acquisition or development, it is recommended that a program of subsurface sampling and laboratory analysis be performed to determine if releases associated with the historical land uses and three open NY Spills/LTANKS cases have impacted soil and/or groundwater at the Subject Property, specifically in areas where construction activities are proposed.

1.0 INTRODUCTION

This report presents the findings of a Phase I Environmental Site Assessment (ESA) conducted by the Parsons Brinckerhoff (PB) Team for the property located at 537-547 Tenth Avenue (Block 1069, Lots 29 and 34), in the Borough of Manhattan, New York (Subject Property). The City of New York (the City) is considering the purchase of the Subject Property for use as part of the No. 7 Subway Extension in conjunction with the Hudson Yards Rezoning and Development Program.

The purpose of this ESA is to identify, to the extent feasible, the presence or likely presence of hazardous substances or petroleum products on or near the property. This report has been prepared for the City and conforms to the American Society for Testing and Materials (ASTM) *Standard Practice for Phase I Environmental Site Assessments* (E 1527-00), in accordance with the "due diligence" regulations of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and in accordance with Section 9601 (35)(b) of the Superfund Amendments and Reauthorization Act (SARA), which requires that "all appropriate inquiry" be made into the presence or potential presence of hazardous substances or petroleum products on site.

2.0 SITE CONDITIONS

2.1 Site Description

The Subject Property is located at 537-547 Tenth Avenue, New York, New York. The Subject Property is identified as Block 1069, Lots 29 and 34 in the City's tax records. A map showing the location of the Subject Property is presented in Figure 1. A site plan is contained in Figure 2. Photographs of the Subject Property and the surrounding area are included in *Appendix A*.

The Subject Property consists of an approximately 17,875-square foot rectangular-shaped parcel located on the west side of Tenth Avenue, between West 40th and West 41st Streets. It is improved with asphalt paving, a single-story concrete block structure and a chain link fence around its perimeter. The property is currently used by a commercial van/light truck rental company.

2.1.1 Topography

Based on a review of the United States Geological Survey (USGS) 7.5-Minute Quadrangle Map, *Central Park, NJ - NY*, dated 1995; the elevation of the Subject Property is approximately 25 feet above mean sea level (MSL). The Subject Property was observed to be on a gently sloping plain, with a slight gradient to the west. A copy of the topographic map is presented in Figure 1.

2.1.2 Geology

The Subject Property is underlain by the Manhattan Prong of the New England Uplands physiographic province. The bedrock of the Manhattan Prong underlies much of southwestern Connecticut, Westchester County, New York, and New York City, and ends at the southern tip of Manhattan Island. Three distinct metamorphic rock formations make up the Manhattan Prong; known collectively as the New York City Group. These formations are: the highly folded and contorted Fordham gneiss, the oldest and most widespread of the formations; the Inwood marble, derived from dolomitic limestone; and the younger Manhattan Formation, consisting largely of mica schist, overlying the Inwood marble and making up most of the rock outcrops on Manhattan Island. The soils are mostly acidic, shallow to deep, and rocky (Baskerville 1989).

Surficial geology in the vicinity of the Subject Property is expected to consist of Pleistocene deposits of till and stratified drift, overlain by Holocene deposits. The till was deposited as ground moraine, is less than 25 feet thick in most places and is discontinuous, while Holocene deposits consist of salt marsh deposits, alluvium and shoreline or beach deposits. These sediments consist of sand, gravel, silt, organic silt, peat, loam and shells. Artificial fill overlies most Holocene deposits and contains various mixtures of soil (Baskerville 1989).

Geotechnical information collected from soil borings advanced in the vicinity of the Subject Property indicates that bedrock is found at a depth of approximately 49 feet below grade and consists of gray mica schist.

2.1.3 Soils

Subject Property soils are characterized as *Laguardia/Ebbets* soils, which are very deep, well drained soils, formed on human created or modified landscapes, in a thick (>40 inches) mantle of human transported materials mixed with construction debris. Coarse fragment (>2mm) content, including natural rocks and human artifacts, averages from 35 to 75% by volume. Most of the artifacts (concrete, asphalt, brick, coal ash, etc.) will act like rock fragments. Permeability is moderate in areas where the soil has not been compacted at the surface, and moderately slow where the surface has been compacted or contains platy structure(s) (USDA, NRCS, 2003).

2.1.4 Hydrology

Manhattan Island is underlain by pre-Cambrian metamorphic rocks which have been tightly folded and subsequently eroded. In most places, these pre-Cambrian rocks are overlain by a thin covering of Pleistocene deposits, consisting chiefly of till. The rock beneath most of the island is the Manhattan schist. Manhattan schist contains some joints, irregular fractures and faults along which groundwater moves, but in some places chemical weathering has filled these openings with clay. The Manhattan schist underlies more than three-fourths of Manhattan, but it is not considered to be an important source of groundwater since openings in the bedrock that yield water through joints and fractures are minimal (Perlmutter and Arnow 1953).

Due to the thinness and low permeability of the Pleistocene till, water yields are low. However, there are two large bodies of stratified drift in Manhattan that contain and yield considerable groundwater. Neither of these bodies, which are associated with the prominent depressions in the bedrock surface, is located in close proximity to the Subject Property. One is located in northern Manhattan (extending from 96th Street and the East River to about 145th Street and the Hudson River), while the other is located in southern Manhattan (all of the island south of 14th Street) (Perlmutter and Arnow 1953).

Based on a review of existing information, groundwater beneath the Subject Property is expected to flow to the west, ultimately discharging into the Hudson River, located approximately 2,000 feet to the west. Surface drainage, based on identified topography, flows west from the Subject Property. Estimated groundwater levels and/or flow direction(s) may vary due to seasonal fluctuations in precipitation, local usage demands, geology, underground structures, or dewatering operations. Stormwater runoff from the Subject Property is expected to drain into stormwater drains located on West 40th and West 41st Streets.

Based on a review of the 1975 New York State Department of Environmental Conservation (NYSDEC) Freshwater Wetlands Map, New York County, Map 2 of 4, no wetlands that are regulated under the Freshwater Wetlands Act are present in the Borough of Manhattan. A review of National Wetlands Inventory (NWI) information present in the EDR Radius Map Report (2003) indicated that no wetlands were present on or adjacent to the Subject Property.

The Federal Emergency Management Agency's digital Q3 flood data for the Subject Property was reviewed (Digital Q3 flood data are developed by scanning the existing Flood Insurance Rate Map (FIRM) hardcopy, vectorizing a thematic overlay of flood risks. Vector Q3 flood data files contain only certain features from the existing FIRM hardcopy and are contained in one single countywide file, including all incorporated and

unincorporated areas of a county. Digital Q3 flood data are designed to support planning activities, some Community Rating System activities, insurance marketing, and mortgage portfolio reviews. The file does not provide base flood elevation information; thus, it has limited application for engineering analysis, particularly for site design. The product is a valuable tool however in screening property addresses within a Geographic Information System to determine flood risks). The Q3 data indicated that the Subject Property is located outside of the 100-year and 500-year flood boundaries. A copy of the Q3 map is included in Figure 3.

2.1.5 Radon

Radon is a colorless, odorless radioactive gas that results from the natural breakdown of uranium minerals in soil, rock, and water, which subsequently enters the atmosphere. It can concentrate in buildings, entering through cracks and other penetrations of a building foundation. Some areas are more likely to have elevated concentrations of radon than others, reflecting subsurface lithologic conditions.

The New York State Department of Health (NYSDOH) maintains a database of radon test results on a local and county level. According to the NYSDOH, area radon information reviewed indicated that the Subject Property is in an area classified as Tier 3 (Low Potential) where the average indoor concentration of radon is less than 2 picocuries per liter (pCi/L), which is less than United States Environmental Protection Agency (USEPA) Action Level of 4 pCi/L. As such, the PB Team concludes that it is unlikely that elevated levels of radon gas are present at the Subject Property.

2.1.6 Adjoining Properties

The general area of the Subject Property consists of commercial and residential land use. The following table summarizes property uses adjacent to the Subject Property:

Direction	Facility Name &/or Description	Street Address &/or Location	Current Use
North	The Victory Building	561 Tenth Avenue	High-Rise Residential Above Ground-Floor Retail & Parking Garage
South	Staging Area for PANYNJ Construction Equipment	531-555 Tenth Avenue	Construction Staging Area
East	Covenant House	460 West 41 st Street	Privately-Funded Childcare Agency
West	Sts. Cyril & Raphael Croatian Roman Catholic Church	West 41 st Street Avenue	Church

3.0 HISTORICAL RESEARCH

The information obtained during the historical use research is a preliminary means of assessing the potential for hazardous material contamination to be present at the Subject Property. Fire insurance maps were reviewed as part of this effort.

3.1 Fire Insurance Maps

Fire insurance maps (Sanborn Maps) identify historical land uses at the Subject Property and adjacent area, as well as potential areas of environmental concern. They typically document land use, structural changes, street addresses, occupants, gas storage areas, raw material pilings, and types of products manufactured and/or stored on site. The PB Team reviewed Sanborn Maps for the Subject Property and surrounding area in order to identify historical land uses that may have involved hazardous substances and petroleum products. Sanborn Map coverage included the years 1890, 1899, 1911, 1930, 1950, 1968, 1979, 1990 and 1996. Copies of the Sanborn Maps and a complete description of Sanborn Map coverage for these years are provided in *Appendix B* with potential RECs noted in ***bold italics***.

The review of the Sanborn Maps indicated that the Subject Property was developed with eight buildings occupied by residences located above undetermined ground-floor commercial uses from 1890 to 1930. The 1911, 1930 and 1950 maps indicate that the ground-floor commercial use located at 539 Tenth Avenue is a Chinese laundry. The 1950 map indicates the presence of a gas station in the northern half of the property, as well as five buildings occupied by residences located above undetermined ground-floor commercial uses. From 1968 to 1979, with the exception of the gas station, the Subject Property was an unoccupied lot. From 1990 to 1996, the northern half of the Subject Property was occupied by the gas station and an automobile repair garage, with the southern half remaining an unoccupied lot.

The review of the Sanborn Maps identified evidence of historical RECs at the Subject Property and surrounding area, as summarized below:

Year	Description	Distance/ Direction	Assumed Hydraulic Gradient
1890	Coal Yard	Adjacent to the West	Crossgradient
1911	Piano Factory	Adjacent to the East	Crossgradient
1930	Chinese Laundry	Subject Property	--
	Gas Station	Adjacent to the East	Crossgradient
1950	Gas Station	Subject Property	--
	Two Gas Stations	Adjacent to the East	Crossgradient
	Coal Yard	200 Feet Northeast	Crossgradient
1968- 1979	Gas Station	Subject Property	--
	Gas Station	Adjacent to the East	Crossgradient
	Bus Terminal	150 Feet Northeast	Crossgradient
1990- 1996	Gas Station	Subject Property	--
	Automobile Repair Garage	Subject Property	--

4.0 REVIEW OF PUBLIC RECORDS

The databases discussed in this section, provided by EDR of Southport, Connecticut, were reviewed for information regarding documented and/or suspected releases of regulated hazardous substances and/or petroleum products on or near the Subject Property. The PB Team also reviewed the "unmappable" (also referred to as "orphan") listings within the database report, cross-referencing available address information and facility names. Unmappable sites are listings that cannot be plotted with confidence, but are identified as being located within the general area of the Subject Property based on the partial street address, city name, or zip code. In general, a listing cannot be mapped due to inaccurate or incomplete address information in the database that was supplied by the corresponding regulatory agency. Listings from the unmappable summary which were identified as a result of the area reconnaissance and/or cross-referencing to mapped listings are included in the corresponding database discussion within this section. A copy of the federal and state regulatory agency database is presented in *Appendix C*.

4.1 Federal and State Regulatory Agency Database Reviews

A summary of sites identified through the federal and state regulatory agency databases review is provided below:

Federal and State List	Site Appears on List	Search Radius*	No. of Sites within Search Radius	Last Updated
National Priorities List for Federal Superfund Cleanup (NPL)	No	1 Mile	0	4/30/03
Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS)	No	½ Mile	0	6/16/03
Resource Conservation and Recovery Information System – Treatment, Storage or Disposal Facilities (RCRIS-TSD)/RCRIS Corrective Action Activity (CORRACTS)	No	½ Mile/ 1 Mile	0	3/31/03
Resource Conservation and Recovery Information System – Generators/Transporters (RCRIS Gen/Trans)	Yes	¼ Mile	22	7/11/03
State Inactive Hazardous Waste Sites (SHWS)	No	1 Mile	0	4/1/02
Solid Waste/Landfills Facilities Sites (SWF/LF)	No	½ Mile	0	7/25/02
New York State Spills Information (NY Spills)/Leaking Underground Storage Tanks (LTANKS)	Yes	1/8 Mile/ ½ Mile	54	1/1/02
Petroleum Bulk Storage Tanks/Chemical Bulk Storage Tanks (USTs/ASTs)/Major Oil Storage Facilities (MOSF)	No	¼ Mile/ ½ Mile	28	1/1/02
Voluntary Cleanup Act	No	½ Mile	0	6/17/03
Registered Waste Tire Storage and Facility List	No	½ Mile	0	11/1/02
Registered Recycling Facility	No	½ Mile	0	5/28/03
Federal Toxic Release Inventory System (TRIS)	No	Subject Property	0	12/31/01
Emergency Response Notification System (ERNS)	No	Subject Property	0	12/31/02

* The surrounding area search radius indicates the radial area (measured from the Subject Property) for which the database review was performed.

The following subsections provide a discussion of the surrounding properties, which have been identified within the search radius and listed in the table.

National Priorities List (NPL) – Superfund

The United States Environmental Protection Agency's (USEPA) NPL (or Superfund List) is a federal listing of uncontrolled or abandoned hazardous waste sites. The list is created from the CERCLIS database (see below) and is primarily based upon a score that each site or facility receives from the USEPA's Hazard Ranking System. After a site or facility has been identified as a CERCLIS site, the USEPA conducts an assessment of the property. The ranking score associated with the degree of contamination found is one of the determinations made as to whether the site is placed on the NPL. These sites are then prioritized for possible long-term remedial action and referred to the state for further action under state programs. The database search indicated that there are no NPL sites within one mile of the Subject Property.

Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS)

The CERCLIS list is a compilation of records from a nationwide database created to maintain and regulate those facilities or sites that the USEPA has investigated or will investigate for suspected or uncontrolled releases of hazardous substances, contaminants or pollutants as reported by states, municipalities, private companies and private citizens under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA or the Superfund Program). Once a site is placed on the CERCLIS list, it may be subjected to several additional levels of evaluation to determine the severity of the contamination. These levels of evaluation range from discovery and preliminary assessment to site inspection, and possibly to the Hazard Ranking System. Such a determination could ultimately place the site under consideration for inclusion on the NPL. Inclusion on the CERCLIS list does not confirm the presence of an environmental problem or a public health threat. Former CERCLIS sites that have been granted the status of No Further Remedial Action Planned (NFRAP) are also included in this database. Neither the Subject Property nor other facilities within a one-half mile radius are listed in the CERCLIS or NFRAP databases.

Resource Conservation and Recovery Information System – Treatment, Storage, or Disposal Facilities (RCRIS TSD)/RCRIS Corrective Action Activity (CORRACTS)

The Resource Conservation and Recovery Act (RCRA) program identifies and tracks hazardous wastes from the point of generation to the point of disposal. The RCRIS database tracks those facilities that treat, store and/or dispose of hazardous materials as defined by RCRA (referred to as TSD facilities). The RCRIS CORRACTS database identifies TSD facilities that have conducted, or are currently conducting, corrective action(s) as regulated under RCRA. Neither the Subject Property nor other facilities within a one half-mile radius are listed in the RCRIS-TSD database or within a one-mile radius in the RCRIS CORRACTS database.

Resource Conservation and Recovery Information System Generators/Transporters (RCRIS Gen/Trans)

This list includes any operation that generates or transports hazardous waste and that must obtain a hazardous waste generator identification number or transporter permit.

Inclusion on the RCRIS database is not necessarily indicative of contamination; rather, it indicates only the presence of potential sources of contamination.

Twenty two RCRIS generator/transporter facilities were identified within a quarter-mile radius of the Subject Property. A former occupant of the Subject Property, Fast Towing & Auto Repair, is listed in the RCRIS database as being a registered RCRIS hazardous waste generator/transporter facility (Table 1). Because Fast Towing is no longer located at the Subject Property, and because no violations were reported, this is not considered an REC.

The remaining RCRIS generator/transporter facilities are not considered RECs based on their status.

State Inactive Hazardous Waste Sites (SHWS)

The New York State Inactive Hazardous Waste Sites database, compiled by the NYSDEC, maintains information regarding the investigation and cleanup of suspected hazardous waste sites. Neither the Subject Property nor other facilities within a one-mile radius are listed in the SHWS database.

Solid Waste/Landfill Facilities (SWF/LF)

The SWF/LF database is a comprehensive listing of state permitted/recorded solid waste facilities. One SWF/LF site was identified within a one-half mile radius of the Subject Property. The identified facility is the former Red Ball Demolition site located at 613 West 29th Street. The Red Ball facility was previously utilized as a solid waste transfer station, which was permanently closed in 1999. However, because the former tenant paved the property prior to the final NYSDEC inspection, the case number associated with the former facility remains open. Based on this site's proximity to the Subject Property (>2,000 feet downgradient), the site is not considered a REC.

New York State Spills Information Database (NY Spills)/Leaking Underground Storage Tanks (LTANKS)

The NY Spills database, including LTANKS sites, was researched to identify listings within one-half mile of the Subject Property. The database identified a total of 54 NY Spills/LTANKS incidents within a one-half mile radius of the Subject Property. Of these, 33 were closed cases and 16 were cross- or downgradient of the Subject Property and are not considered RECs. Of the remaining five open cases, one is the Subject Property and four are either upgradient or in close proximity (adjacent) to the Subject Property. These five are summarized in the table below. See Table 2 for a list of all open NY Spills/LTANK cases.

Listing	Distance/ Direction	Assumed Hydraulic Gradient	Available Data
547 Tenth 95 Avenue	Subject Property	—	Spill Case No. 9503865. Contaminated soil discovered during tank removal at an old gas station on 6/29/95.
Hunter College 450 West 41 st Street	200 Feet East	Upgradient	Spill Case No. 9504490. Unknown quantity of No. 6 fuel oil discovered beneath an abandoned UST.
505-509 West 41 st Street	400 Feet North-northeast	Upgradient	Spill Case No. 9912551. Spill of an unknown quantity of No. 2 fuel oil on 2/3/00.
575 Tenth Avenue	400 Feet North-northeast	Upgradient	Spill No. 9815316. Construction of a billboard adjacent to a Gaseteria gas station is causing fumes.
West 39 th Street & Ninth Avenue	Approx. ¼ mile Southeast	Upgradient	Spill Case No. 8911942. Leak of approximately 200 gallons of No. 2 fuel oil due to a tank failure on 3/16/90.

Based on the distances, assumed hydraulic gradients, and current regulatory status, the first three cases listed above are considered RECs because they have the potential to have impacted soil and/or groundwater at the Subject Property. The remaining two facilities listed are not considered RECs. Although upgradient of the Subject Property, these cases do not involve releases that have the potential to impact the Subject Property based on their distances and/or the significance of the reported spill.

Petroleum/Chemical Bulk Storage Tanks (USTs/ASTs)

The State of New York regulates underground storage tanks (USTs) and above ground storage tanks (ASTs) according to their contents and capacity, as described below.

- **Petroleum Bulk Storage (PBS) Report:** This report is a comprehensive listing of all reported facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons.
- **Chemical Bulk Storage (CBS) Report:** This report contains information pertaining to facilities that store hazardous substances in aboveground storage tanks (ASTs) with capacities of 185 gallons or more and underground storage tanks (USTs) of any size.
- **Major Oil Storage Facilities (MOSF) Report:** This report contains summary information on facilities with petroleum storage capacities in excess of 400,000 gallons.

The PBS and CBS databases were researched to identify listings for the Subject Property located within a quarter-mile radius. The PBS database revealed 27 facilities

and the CBS database revealed one facility. No MOSF facilities were identified within one-half mile. Neither the Subject Property nor any adjacent properties were identified on these databases.

Voluntary Cleanup (VCP)

The State Voluntary Cleanup (VCP) Agreements database or Brownfields is a state database that identifies contaminated sites privately funded that are remediated to levels allowing for the site's productive use. No facilities are located within a one-half mile radius of the Subject Property.

Registered Waste Tire Storage and Facility List (SWTIRE)

The Registered Waste Tire Storage and Facility List (SWTIRE) is a state database that identifies registered waste and tire storage facilities. No facilities were identified within a one-half mile radius of the Subject Property.

Registered Recycling Facility List (SWRCY)

The Registered Recycling Facility List (SWRCY) is a state database that identifies registered recycling facilities. No facilities were identified within a one-half mile radius of the Subject Property.

Federal Toxic Chemical Release Inventory System (TRIS)

The Toxic Chemical Release Inventory System (TRIS) is a federal database that identifies toxic chemical release sites located on the Subject Property. No sites were identified on the Subject Property.

Emergency Response Notification System (ERNS)

The Emergency Response Notification System (ERNS) is a national database used to collect information on reported releases of oil and hazardous substances. The Subject Property is not listed on the ERNS database.

4.2 Agency Correspondence

A review of federal, state, and local records for the Subject Property was accomplished by contacting offices of various regulatory agencies. The results of the review of local records are presented below. Copies of the correspondences are included in *Appendix D*.

United States Department of Environmental Protection (USEPA)

USEPA information concerning the Subject Property was requested in a letter dated September 18, 2003. A response has not yet been received from USEPA.

New York State Department of Environmental Conservation (NYSDEC)

NYSDEC information concerning the Subject Property was requested in a letter dated September 18, 2003. A response has not yet been received from NYSDEC.

Fire Department of the City of New York (FDNY)

FDNY is responsible for the enforcement of local fire codes pertaining to the use and storage of flammable and hazardous materials. FDNY information concerning USTs, sealed or removed underground storage tanks, and history of leaks at the Subject Property was requested in a record search form dated September 18, 2003. In a response dated October 7, 2003, FDNY stated there was no record of the Subject Property.

New York City Department of Health (NYCDOH)

The NYCDOH, Office of Environmental Investigations (OEI) maintains files of health related environmental incidents in the City of New York. These incidents may include spills of hazardous chemicals, citizen's complaints regarding asbestos issues, or reports of chemical odors or fumes. NYCDOH information concerning the Subject Property was requested in a letter dated September 18, 2003. A response has not yet been received from NYCDOH.

New York City Department of Environmental Protection (NYCDEP)

The NYCDEP maintains files of incidents involving environmentally regulated materials. The records maintained by NYCDEP include reports of spills of hazardous chemicals and citizen's complaints on environmental issues. NYCDEP information concerning the Subject Property was requested in a letter dated September 18, 2003. A response has not yet been received from NYCDEP.

5.0 SITE INSPECTION

An inspection of the Subject Property was conducted on September 25, 2003 by Mr. Donald Ehrenbeck of The PB Team, accompanied by a representative of NYCT.

The Subject Property, currently used as a commercial truck and van rental facility, is an approximately 17,875-square foot lot paved with asphalt. The Subject Property is bound on all sides by a chain-link fence. A church is located adjacent to the Subject Property to the west and a staging area for construction equipment is located to the south, across West 40th Street. The Victory Building, a residential high-rise, is located to the north, across West 41st Street and Covenant House, a private childcare facility, is located to the east, across Tenth Avenue.

The northern half of the Subject Property is occupied by a single-story concrete block structure with two bay doors. The building is similar in design to a gas station building, which is consistent with the Sanborn map review, which notes the presence of a gas station on the site from at least 1950 to 1996. The building is utilized as the offices of Courier Car Rentals, Inc. According to an employee, the building is heated by electric baseboards and no vehicle fueling is performed onsite. The former garage area of the building is utilized for storage. No automobile lifts were observed in this area.

South of the building, the area is paved and occupied by a billboard. In the vicinity of the billboard and slightly to the north, the remains of a building foundation are visible protruding from the asphalt. This observation is consistent with the Sanborn map review, which notes the presence of an automobile repair garage until approximately 1996. The southern half of the Subject Property is paved and used for vehicle parking.

No evidence of fill and vent pipes associated with USTs was observed on the Subject Property or surrounding sidewalks. Minor pavement staining, typical of parking lots, was observed in various locations. This staining is considered a *de minimus* condition. No other evidence of contamination was observed, and no RECs were identified during the site inspection.

6.0 INTERVIEWS

The PB Team interviewed a representative of the owner of the Subject Property, Mr. Gary Greene, on September 25, 2003. Mr. Greene assists in property management affairs for the owner, Ms. Lillian Goldman. He stated that the property was acquired through a foreclosure several years ago and that he had no first-hand knowledge of the site.

7.0 FINDINGS

The PB Team has performed a Phase I ESA of the property located at 537-547 Tenth Avenue in the Borough of Manhattan, New York. The ESA conforms to the American Society for Testing and Materials (ASTM) *Standard Practice for Phase I Environmental Site Assessments* (E 1527-00). The Phase I ESA included a site inspection, a review of the site history and a public records search.

7.1 On-Site Conditions

Based on the review of historical fire insurance maps, the Subject Property was developed with several buildings in 1930, among which was one that was labeled as a "Chinese Laundry". From at least 1950 to 1996, the Subject Property was occupied by a gas station. From at least 1990 to 1996, an automobile repair garage was also present. The Subject Property is also an active NY Spills/LTANKS location. The historical use of the Subject Property as a "Chinese Laundry", a gas station and an automobile repair garage; and its status as an active NY Spills/LTANKS location, are identified as RECs.

7.2 Off-Site Conditions

The historical uses of several properties located in the vicinity of the Subject Property are considered RECs:

- A coal yard was located adjacent to the west of the Subject Property in 1890.
- A piano factory was located adjacent to the east of the Subject Property in 1911.
- A gas station was located adjacent to the east of the Subject Property in 1930.
- Two gas stations were located adjacent to the east of the Subject Property in 1950, a bus terminal was located 150 feet northeast, and a coal yard was located 200 feet northeast.

Two active NY Spills/LTANKS locations in the vicinity of the Subject Property are considered RECs and are listed below:

- 450 West 41st Street
- 505-509 West 41st Street

These active spills defined as RECs are located within 400 feet of the Subject Property. Both involved the release of an unknown quantity of fuel oil. Based on the absence of adequate remediation data or definitive boundaries of possible contamination, these spill locations are considered RECs.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The PB Team performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-00. The assessment identified several RECs both on and in the vicinity of the Subject Property. RECs identified on the Subject Property include an open NY Spills/LTANKS case and its historical use as a Chinese Laundry, a gas station and an automobile repair garage. Those identified in the vicinity of the Subject Property include two open NY Spills/LTANKS cases and historical land uses.

Based on the findings of this Phase I ESA, it does not appear that the RECs identified would preclude use of the Subject Property as part of the No. 7 Subway Extension in conjunction with the Hudson Yards Rezoning and Development Program. However, the PB Team recommends that a program of subsurface sampling and laboratory analysis be undertaken to determine if releases associated with the historical land uses and three open NY Spills/LTANKS cases have impacted soil and/or groundwater at the Subject Property, specifically in areas where construction activities are proposed.

9.0 LIMITATIONS

PHASE I ESA FOR 537-547 TENTH AVENUE – NEW YORK, NY

This investigation was limited to the review of available records, interviews with available on-site personnel and local officials, and an on-site inspection. The site inspection was limited to observation of surficial conditions only. Such an inspection cannot be expected to reveal all hazardous materials or situations that might be present on site; some hazardous materials or conditions may exist and not be detected because they are beyond the scope of this study. The investigation was conducted in a manner consistent with the level of care and skill exercised by environmental professionals currently practicing under similar conditions and was based on information made available to the representatives of The PB Team. All documents prepared by or furnished by The PB Team pursuant to this project are to be used in the context of the scope of services contracted. This document is not intended or represented to be suitable for reuse by the client or others on modifications of the project scope. Reuse or release to third parties without the expressed written permission of the consultant is prohibited.

SANBORN FIRE INSURANCE MAPS

SANBORN MAP REVIEW

Year	Comments
1890	<p>Subject Property: The Subject Property appears to be part of a <i>foundry</i>, the "<i>J.B. & J.M. Cornell's Iron Works</i>".</p> <p>Surrounding Properties: To the east and south the adjoining properties also appear to be part of the <i>foundry</i>. Properties to the north, beyond West 26th Street, appear to be a marble works and a <i>brass and bronze works</i>. The adjoining property to the west appears to be a lumber yard.</p>
1899	<p>Subject Property: The Subject Property appears unchanged from the 1890 map.</p> <p>Surrounding Properties: Surrounding properties all appear unchanged from the 1890 map.</p>
1911	<p>Subject Property: The Subject Property appears occupied by a <i>junkyard</i>.</p> <p>Surrounding Properties: To the east, the adjoining property appears to be occupied by the "Knickerbocker Ice Company." To the south, the adjoining properties appear to be occupied by a 3-story building labeled "<i>Standard Oil Co, Polarine Oil Storage</i>" and a building labeled as an "<i>automobile garage</i>." East of this structure is a property labeled as a "<i>tin foil factory</i>." Two properties to the north, beyond West 26th Street, appear to be a vacant lot and a 6-story structure of unknown occupancy. The property to the west appears unchanged from the 1890 map.</p>
1930	<p>Subject Property: The Subject Property appears occupied by a structure labeled "Building Materials".</p> <p>Surrounding Properties: To the east is a structure labeled as a "<i>Garage</i>" containing "<i>2 550-gallon gasol tanks buried</i>". Beyond the garage is a structure labeled "<i>Printing and Bookbinding</i>" that contains "<i>2 8,000-gallon press and 1 30,000-gallon gravity tanks</i>" and "<i>9,000-gallon press and 11,000-gallon gravity tanks</i>". To the south, the 1911 Standard Oil building, while remaining, is labeled as "Vacant". East of the Standard Oil building, the former automobile garage now contains a "<i>Copper Warehouse</i>" and a dairy with "<i>1 550-gallon gasol tank buried</i>". The tin foil factory is still present. To the north, beyond West 26th Street, the 6-story structure is labeled as having a garage on the 1st floor and "<i>2 550-gallon gasol tanks buried</i>" as well as a "<i>12,000-gallon gravity tank</i>". The formerly vacant property appears to be occupied by a 7-story commercial building. The southeast corner of this structure is labeled "<i>Garage</i>" with "<i>2 275-gallon gasol tanks Bas</i>". The northwest corner of this structure is labeled "<i>1 30,000-gallon gravity tank</i>". The property adjacent to the west appears unchanged from the 1890 map.</p>
1950	<p>Subject Property: The Subject Property appears unchanged from the 1930 map.</p> <p>Surrounding Properties: For properties to the east, details are unreadable due to the quality of the map reproduction. Properties to the south appear unchanged from the 1930 map, except that the vacant Standard Oil building is labeled "W Ho Electric Supplies" and the former tin factory is labeled "HQ & Offices Photograph Records". The properties to the north, beyond West 26th Street, and west appear unchanged from the 1930 map.</p>
1976	<p>Subject Property: The Subject Property appears to be vacant.</p> <p>Surrounding Properties: Properties to the east appear unchanged from the 1930 map. To the south, the former Standard Oil building is now labeled "Paper Products". East of this, the former copper warehouse appears to be a garage. The properties to the north, beyond West 26th Street, appear unchanged from the 1930 and 1950 maps. The property to the west appears to be vacant, undeveloped land.</p>
1980	<p>Subject Property: The Subject Property appears to be occupied by a one-story concrete block building and is labeled as "<i>Truck Rental</i>" and "Trailer Parking".</p> <p>Surrounding Properties: Properties to the east appear unchanged from the 1976 map. To the south, properties appear unchanged from the 1976 map, with the exception of the former paper products building, which is now of unknown occupancy. The properties to the north, beyond West 26th Street, appear unchanged from the 1976 map. The property to the west appears unchanged from the 1976 map.</p>

Year	Comments
1985	<p>Subject Property: The one-story building now has an addition, otherwise the Subject Property appears unchanged from the 1980 map.</p> <p>Surrounding Properties: Properties to the east, south, north and west appear unchanged from the 1980 map, with one exception. The garage to the north, beyond West 26th Street, is now labeled as <i>"Auto Repair"</i>.</p>
1988	<p>Subject Property: The Subject Property appears unchanged from the 1985 map.</p> <p>Surrounding Properties: Properties to the east, south, north and west appear unchanged from the 1980 map.</p>
1992 - 1996	<p>Subject Property: The Subject Property appears to be used for "Truck Parking".</p> <p>Surrounding Properties: Properties to the east, south, north and west appear unchanged from the 1988 map.</p>

To the south, the former Standard Oil building is now labeled "Paper Products". East of this, the former copper warehouse appears to be a garage. The properties to the north, beyond West 26th Street, appear unchanged from the 1930 and 1950 maps. The property to the west appears to be vacant, undeveloped land.</p>
1980	<p>Subject Property: The Subject Property appears to be occupied by a one-story concrete block building and is labeled as "Truck Rental" and "Trailer Parking".</p> <p>Surrounding Properties: Properties to the east appear unchanged from the 1976 map. To the south, properties appear unchanged from the 1976 map, with the exception of the former paper products building, which is now of unknown occupancy. The properties to the north, beyond West 26th Street, appear unchanged from the 1976 map. The property to the west appears unchanged from the 1976 map.</p>

Year	Comments
1985	Subject Property: The one-story building now has an addition, otherwise the Subject Property appears unchanged from the 1980 map. Surrounding Properties: Properties to the east, south, north and west appear unchanged from the 1980 map, with one exception. The garage to the north, beyond West 26 th Street, is now labeled as " Auto Repair ".
1988	Subject Property: The Subject Property appears unchanged from the 1985 map. Surrounding Properties: Properties to the east, south, north and west appear unchanged from the 1980 map.
1992 - 1996	Subject Property: The Subject Property appears to be used for "Truck Parking". Surrounding Properties: Properties to the east, south, north and west appear unchanged from the 1988 map.

EXECUTIVE SUMMARY

The Parsons Brinckerhoff (PB) Team was retained by New York City Transit (NYCT) to perform a Phase I Environmental Site Assessments (ESA), for the properties located at 537 – 547 Tenth Avenue (hereafter referred to as "Site M"), New York, New York (Block 1069, Lots 29 and 34) for the No. 7 Subway Extension.

Site M is bound on the north by West 41st Street, on the south by West 40th Street, to the west by St. Raphael's Catholic Church, and on the east by Tenth Avenue. Site M is comprised of a 1-story CC Truck Rental Office and a paved, ground level parking lot.

During construction, Site M may be utilized as a temporary access for spoil removal for the Tenth Avenue Station cavern and various staging activities. The northern section of Site M would be excavated approximately 75 feet below grade for a new systems building to support the proposed Tenth Avenue Station of the No. 7 Subway Extension. These construction activities would occur primarily below grade through mining (drill and blasting) and excavation (cut-and-cover). The No. 7 Subway Extension running tunnel under West 41st Street, just north of Site M, would be mined by a Tunnel Boring Machine (TBM). The proposed development would require some degree of existing soil and bedrock excavation/removal, soil reuse and disposal, and dewatering to allow for construction. Potential exposure to hazardous materials is increased in areas of subsurface penetration such as during construction activities on Site M.

The purpose of the Phase II ESI was to determine if the environmental conditions identified in the Phase I Environmental Site Assessment (ESA), prepared by the PB Team in June 2004 (PB, 2004) for MTA/NYCT, have resulted in soil and/or groundwater impacts at the Site, and as such, would require management measures. The results of the Phase II ESI were then used to characterize chemical and physical characteristics of the soil and groundwater at the Site. The characterization was used to evaluate potential risks to workers and the general public, and it provides guidance to determine the required procedures for managing soil and/or groundwater encountered during construction.

The field investigation was performed from December 21st to December 22nd, 2005 and included the advancement of ten (10) soil borings and collection of three (3) groundwater samples. All borings were advanced to a refusal, which was encountered at approximate depths of 15 to 30 feet below the ground surface. At locations where shallow refusals were encountered, repeated attempts were made to reach the anticipated depth of the bedrock. The depth of deep refusals during this investigation was consistent with the anticipated depth of the bedrock (with the exception of GP-5 - see below). One common characteristic of all sampling locations at this site was a very significant thickness of structural fill composed primarily of construction debris (up to 16 feet). At location GP-5, at the center of the northern section of the site, the entire sampling column from the grade to 16' below grade (BG) was composed of construction debris, with a refusal at 16' BG likely due to the debris.

Samples from all soil borings were submitted for analysis for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) identified in the New York State Department of Environmental Conservation (NYSDEC) Spill Technology and Remediation Series Memo #1 (STARS), Target Analyte List (TAL) Metals, pesticides and polychlorinated biphenyls (PCBs), PLM Asbestos and Resource Conservation and the Recovery Act (RCRA) Waste Characteristics reactivity, corrosivity, and flashpoint.

The laboratory results indicate that the soils at the Site contain elevated concentrations of SVOCs, pesticides and metals. The compounds detected are commonly present in fill materials located throughout New York City. The absence of high concentrations of target contaminants in the groundwater samples indicates the likelihood of relatively small-quantity localized releases of SVOC on-site, as well as the presence of high levels of metals in the structural fill used to raise the surface elevation of the site. The NYSDEC may not permit reuse of soil excavated from the site due to the elevated concentrations of SVOCs and metals. Based on the results of the laboratory analysis, the subsurface material excavated during construction would likely be classified as non-hazardous waste if it is determined that off-site disposal is required.

Prior to construction, the Contractor is required to prepare an Environmental Assessment Report (EAR), which shall include pre-construction characterization of all materials to be generated during construction.

The proposed excavation will extend into the bedrock, to depths in excess of the maximum depth achieved during the Phase II assessment. A possibility exists for contaminants to be present in the fractured bedrock below the Site M; however, based on results of this study the possibility of this is very low. The Contractor will be required to prepare a Site-Specific Health and Safety Plan and Site-Specific Soil Management Plan to address the handling and management of soil excavated from the Site during the construction activities. Due to the extent of excavation and proposed construction activities at the Site, off-site disposal of soil is expected. The laboratory results indicate that soil would likely be classified as non-hazardous waste.

The groundwater samples were analyzed for VOCs, SVOCs, TAL Metals, and PCBs. Additionally, one groundwater sample was analyzed for New York City Department of Environmental Protection (NYCDEP) Limitations for Effluent to Sanitary or Combined sewers.

The results of the laboratory analyses of groundwater revealed that in the northern section of the Site, slight VOC and metal contamination is present in the groundwater. However, none of the parameters (with the exception of Zinc and Total Suspended Solids (TSS)) exceed the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) No. 1.1.1 criteria or the NYCDEP Limitations for Effluent to Sanitary or Combined sewers. The elevated concentrations of Zinc, as well as elevated TSS values can be removed by the use of a sedimentation tanks prior to discharge into the sewer.

1.0 INTRODUCTION

The Parsons Brinckerhoff (PB) Team was retained by New York City Transit (NYCT) to perform a Phase I Environmental Site Assessments (ESA), for the properties located at 537 – 547 Tenth Avenue (hereafter referred to as "Site M"), New York, New York (Block 1069, Lots 29 and 34) for the No. 7 Subway Extension.

During construction, Site M may be utilized as a temporary access for spoil removal for the Tenth Avenue Station cavern and various staging activities. The northern section of Site M would be excavated approximately 75 feet below grade for a new systems building to support the proposed Tenth Avenue Station of the No. 7 Subway Extension. These construction activities would occur primarily below grade through mining (drill and blasting) and excavation (cut-and-cover). The No. 7 Subway Extension running tunnel under West 41st Street, just north of Site M, would be mined by a Tunnel Boring Machine (TBM). The proposed development would require some degree of existing soil and bedrock excavation/removal, soil reuse and disposal, and dewatering to allow for construction. Potential exposure to hazardous materials is increased in areas of subsurface penetration such as during construction activities on Site M.

The purpose of the Phase II ESI was to determine if the environmental conditions identified in the Phase I Environmental Site Assessment (ESA), prepared by the PB Team in June 2004 (PB, 2004) for MTA/NYCT, have resulted in soil and/or groundwater impacts at the Site, and as such, would require management measures. The results of the Phase II ESI were then used to characterize chemical and physical characteristics of the soil and groundwater at the Site. The characterization was used to evaluate potential risks to workers and the general public, and it provides guidance to determine the required procedures for managing soil and/or groundwater encountered during construction.

The Phase I ESA identified Recognized Environmental Conditions (RECs) associated with Site M. These RECs are listed below.

- *Historical Use of Property.* Site M (Lots 29 and 34, CC Truck Rental Office and Parking Lot) is located between West 41st Street and West 40th Street along Tenth Avenue, in an area primarily characterized by industrial, transportation, manufacturing, commercial, and limited residential uses. Based on a review of Sanborn Fire Insurance Maps, historical uses of the Subject Property considered RECs include: a "Chinese Laundry", a gas station and an automobile repair garage at the Subject Property, and
- *Historic Fill.* Site M was constructed on land that was filled-in during the later part of the 18th Century. The material used to create the land is of an unknown source and may contain elevated concentrations of Semi-Volatile Organic Compounds and/or metals.
- *Historical Use of Surrounding Properties.* At adjoining properties the REC's included: a coal yard, a piano factory and several gas stations, which may have resulted in release of petroleum, and possibly metals, to subsurface soil and groundwater, which could affect conditions at the property.
- *Petroleum Release On-Site and Surrounding Properties.* The New York Spills/Leaking Underground Storage Tanks (NY Spills/LTANKS) database, identified the Subject Property and a total of 54 NY Spills/LTANKS incidents within a one-half mile radius of the Subject Property. Of these, 33 were closed cases and 16 were cross- or downgradient of the Subject Property and are not considered RECs. Of the remaining

five open cases, one is the Subject Property and four are either upgradient or in close proximity (adjacent) to the Subject Property. Based on the distances, assumed hydraulic gradients, and current regulatory status, three cases are considered RECs because they have the potential to have impacted soil and/or groundwater at the Site M. The remaining two facilities listed are not considered RECs. Although upgradient of the Site M, these cases do not involve releases that have the potential to impact the Site M based on their distances and/or the significance of the reported spill. Contaminated soil discovered during tank removal at an old gas station on 6/29/95.

A site visit was conducted in September 2003 and November 2005. Site M is currently used as a commercial truck and van rental facility, and is an approximately 17,875-square foot lot paved with asphalt. Site M is bound on all sides by a chain-link fence. A church is located adjacent to the Site M to the west and a staging area for construction equipment is located to the south, across West 40th Street. The northern half of the Site M is occupied by a single-story concrete block structure with two bay doors. The building is similar in design to a gas station building, which is consistent with the Sanborn map review, which notes the presence of a gas station on the site from at least 1950 to 1996. The building is utilized as the offices of Courier Car Rentals, Inc. According to an employee, the building is heated by electric baseboards and no vehicle fuelling is performed onsite. The former garage area of the building is utilized for storage. No automobile lifts were observed in this area. South of the building, the area is paved and occupied by a billboard. In the vicinity of the billboard and slightly to the north, the remains of a building foundation are visible protruding from the asphalt. This observation is consistent with the Sanborn map review, which notes the presence of an automobile repair garage until approximately 1996. The southern half of Site M is paved and used for vehicle parking. No evidence of fill and vent pipes associated with USTs was observed on the Site M or surrounding sidewalks. Minor pavement staining, typical of parking lots, was observed in various locations. This staining is considered a *de minimus* condition. No other evidence of contamination was observed, and no RECs were identified during the site inspection.

Because the Phase I ESA indicated potential sources of contamination (e.g., historical fill, historic site usage, underground storage tanks, nearby off-site sources), it is necessary to characterize the potential for subsurface materials to contain hazardous materials. As such, further investigations of the soil and groundwater quality of Site M are necessary and can be determined through a Phase II Environmental Site Investigation (ESI) of the property.

The objective of the Phase II ESI is to determine if the RECs identified in the Phase I ESA have resulted in soil and/or groundwater contamination beneath the Site that would require management measures. The results of the Phase II ESA are then used to characterize soil and groundwater at the Site and evaluate the potential risks to workers and the general public, as well as provides guidance on determining the procedures for managing soil and groundwater encountered during construction.

Phase II ESI consisted of the advancement of ten (10) soil borings (GP1-GP10) and collection of three (3) groundwater samples for laboratory analyses. Soil samples were collected for laboratory analysis from each of the borings as described in Section 4.1. Groundwater samples were collected from two temporary groundwater monitoring points and from one existing monitoring well.

This report provides a summary of the Site and surrounding area, the findings of the ESA, a discussion of the ESA activities performed, a presentation of the ESA findings and conclusions and recommendations.

2.0 BACKGROUND

As part of the Phase I ESA (PB, 2004) historical records (e.g., site land uses) and regulatory agency databases were reviewed; as a result of this review, RECs were identified both on- and off-site. On-site RECS include a "Chinese Laundry", a gas station and an automobile repair garage. At adjoining properties the REC's included a coal yard, a piano factory and several gas stations, which may have resulted in release of petroleum, and possibly metals, to subsurface soil and groundwater, which could affect conditions at the property. Also according to the Phase I ESA, three spill cases are considered RECs because of the proximity and assumed hydraulic gradients have the potential to have impacted soil and/or groundwater at the Site M.

The site reconnaissance portion of the Phase I ESA identified the presence of possible asbestos-containing materials (ACM) used in the construction of the 1-story building on-site, as well as, former USTs. A gas station operated on the site from at least 1950 to 1996. No details on the date of installation or tightness testing were available for storage tanks. An asbestos inspection and material survey was subsequently performed and its findings are under separate cover.

Review of regulatory agency databases identified the Site on the Emergency Response Notification System (ERNS) database, which is a record of spills of hazardous materials reported to the United States Environmental Protection Agency (USEPA). No further information regarding spills of hazardous materials was available.

Review of regulatory agency databases identified three facilities with active New York Spills/Leaking Underground Storage Tanks (NY Spills/LTANKS) cases that are considered RECs. Two of the three spills have the same address as facilities listed in the Resource Conservation and Recovery Information System Generators/Transporters (RCRIS Gen/Trans) database.

A review of Site history, regulatory agency records, and observations made during a field screening of geotechnical alignment soil borings indicate that contamination, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polychlorinated biphenyls (PCBs) may be present in subsurface soil and groundwater.

3.0 PHYSICAL SETTING

Site M is situated in an area (see Figures 1 and 2) that was originally nearby the historic shoreline of the Hudson River located near the present Eleventh Avenue. Through urban developments, which began in the mid-1800s, the area was extended toward the shoreline and beyond the present Eleventh Avenue, and was filled with soil, rock and miscellaneous debris to create land that was utilized in the late 1800s by a "Chinese Laundry", and then later as a gas station and an automobile repair shop (Sanborn Fire Insurance Maps). CC Truck Rental is the present owner of Site M and operates a truck rental business, utilizing the building for offices and the parking lot as for vehicle storage.

3.1 Topography

Based on a review of the United States Geological Survey (USGS) 7.5-Minute Quadrangle Map, *Weehawken and Jersey City, New Jersey-New York, Central Park, New York - New Jersey, and Brooklyn, New York Quadrangles*, the elevation of the Site is approximately 25 feet above mean sea level. The site reconnaissance revealed the Site to be on a gently sloping plain, with a slight gradient to the west. The PB Team's review of the USGS map indicated that the area's general topographic gradient is to the west. A copy of the topographic map is presented in Figure 1.

3.2 Geology

Site M is underlain by the Manhattan Prong of the New England Uplands physiographic province. The bedrock of the Manhattan Prong underlies much of southwestern Connecticut, Westchester County, New York, and New York City, and ends at the southern tip of Manhattan Island. Three distinct metamorphic rock formations make up the Manhattan Prong; known collectively as the New York City Group. These formations are: the highly folded and contorted Fordham gneiss, the oldest and most widespread of the formations; the Inwood marble, derived from dolomitic limestone; and the younger Manhattan Formation, consisting largely of mica schist, overlying the Inwood marble and making up most of the rock outcrops on Manhattan Island. The soils are mostly acidic, shallow to deep, and rocky (Baskerville 1989). Surficial geology in the vicinity of the Site M is expected to consist of Pleistocene deposits of till and stratified drift, overlain by Holocene deposits. The till was deposited as ground moraine, is less than 25 feet thick in most places and is discontinuous, while Holocene deposits consist of salt marsh deposits, alluvium and shoreline or beach deposits. These sediments consist of sand, gravel, silt, organic silt, peat, loam and shells. Artificial fill overlies most Holocene deposits and contains various mixtures of soil (Baskerville 1989).

3.3 Hydrology

Manhattan Island is underlain by pre-Cambrian metamorphic rocks which have been tightly folded and subsequently eroded. In most places, these pre-Cambrian rocks are overlain by a thin covering of Pleistocene deposits, consisting chiefly of till. The rock beneath most of the island is the Manhattan schist. Manhattan schist contains some joints, irregular fractures and faults along which groundwater moves, but in some places chemical weathering has filled these openings with clay. The Manhattan schist underlies more than three-fourths of Manhattan, but it is not considered to be an important source of groundwater since openings in the bedrock that yield water through joints and fractures are minimal (Perlmutter and Arnow 1953). Due to the thinness and low permeability of the Pleistocene till, water yields are low. However, there are two large bodies of stratified drift in Manhattan that contain and yield considerable groundwater. Neither of these bodies, which are associated with the prominent depressions in the bedrock

surface, is located in close proximity to the Site M. One is located in northern Manhattan (extending from 96th Street and the East River to about 145th Street and the Hudson River), while the other is located in southern Manhattan (all of the island south of 14th Street) (Perlmutter and Arnow 1953).

Based on a review of existing information, groundwater beneath Site M is expected to flow to the west, ultimately discharging into the Hudson River, located approximately 1,000 feet west of Site M. Surface drainage, based on identified topography, flows west from Site M. Estimated groundwater levels and/or flow direction(s) may vary due to seasonal fluctuations in precipitation, local usage demands, geology, underground structures, or dewatering operations. Stormwater runoff from the Site M is expected to drain into stormwater drains located along West 41st Street and Tenth Avenue. Based on a review of the 1975 New York State Department of Environmental Conservation (NYSDEC) Freshwater Wetlands Map, New York County, Map 2 of 4, no wetlands that are regulated under the Freshwater Wetlands Act are present in the Borough of Manhattan. A review of National Wetlands Inventory (NWI) information indicated that no wetlands were present on or adjacent to the Subject Property. The Federal Emergency Management Agency's digital Q3 flood data for Site M were reviewed. The Q3 data indicated the Subject Property is located outside the 100-year and 500-year flood boundaries. Digital Q3 flood data are developed by scanning the existing Flood Insurance Rate Map (FIRM) hardcopy, vectorizing a thematic overlay of flood risks. Vector Q3 flood data files contain only certain features from the existing FIRM hardcopy and are contained in one single countywide file, including all incorporated and unincorporated areas of a county. Digital Q3 flood data are designed to support planning activities, some Community Rating System activities, insurance marketing, and mortgage portfolio reviews. The file does not provide base flood elevation information; thus, it has limited application for engineering analysis, particularly for site design. The product is a valuable tool however in screening property addresses within a Geographic Information System to determine flood risks.

4.0 TECHNICAL OVERVIEW

The field effort for the Phase II ESA was performed from December 21 to December 22, 2005 and consisted of the advancement of ten (10) environmental soil borings and sampling of three (3) groundwater monitoring wells in accordance with the Work Plan (PB, 2005). Deviations from the Work Plan are described within the following paragraphs.

An asbestos inspection and material survey was also performed and its findings are under separate cover.

4.1 Environmental Soil Sampling

Ten environmental soil borings were advanced at the Site and were identified as borings GP-1 through GP-10. The soil boring locations are presented on Figure 3.

Project representatives performed utility clearance notification prior to drilling. After the boring locations were selected, and cleared of obstructions, the soil borings were initiated by hand auguring to a depth of 5 feet (where possible) below the ground surface (ftbgs) to provide an additional level of protection against disrupting any unknown utilities buried below the surface.

Soil samples were collected for laboratory analysis from each of the borings.

Drilling was performed by Precision Sampling, Inc. of Yorktown, NY and ZEBRA Environmental of Lynbrook, NY.

All borings were advanced to a refusal, which was encountered at approximate depths of 15 to 30 feet below the ground surface. At locations where shallow refusals were encountered, repeated attempts were made to reach the anticipated depth of the bedrock. The depth of deep refusals during this investigation was consistent with the anticipated depth of the bedrock (with the exception of GP-5 - see below). One common characteristic of all sampling locations at this site was a very significant thickness of structural fill composed primarily of construction debris (up to 16 feet). At location GP-5, at the center of the northern section of the site, the entire sampling column from the grade to 16' below grade (BG) was composed of construction debris, with a refusal at 16' BG likely due to the debris.

Soil samples were retrieved using 4-foot long, 2-inch diameter Macro-Core samplers advanced continuously from the grade to the refusal. The recovered soils were lithologically classified using the Burmister field soil classification system. Boring logs were generated for each location, and are provided in Appendix A and soils encountered are described in Section 3.2.

During the advancement of the soil borings, a PB Team member visually inspected and continuously screened recovered soil samples and soil cuttings for organic vapors using a 10.2 eV photo-ionization detector (PID). There were no visual or olfactory indicators of contamination observed in soil recovered from the soil borings. Soil PID screening results are provided on the boring logs in Appendix A.

The soil borings were installed to investigate potential impacts associated with historic usage and current spills.

Samples were analyzed for VOCs, SVOCs, TAL Metals, Pesticides/Herbicides (only for samples to be collected from the depth interval of 0 to 6 ftbgs), PLM Asbestos and PCBs identified in the

NYSDEC TAGM HWR-4046 and RCRA Waste Characteristics (i.e., toxicity, reactivity, corrosivity, and flammability).

Soil samples were collected in laboratory-supplied glassware, were labeled with the project name, sample location, time of collection, and stored at a temperature below 4°C prior to delivery to American Analytical Laboratories LLC of Farmingdale, NY for laboratory analyses.

Following completion of the soil borings, and collection of groundwater samples as described in Section 4.2, the drilling contractor grouted the soil borings to the surface and restored the surface with like materials (e.g., asphalt or concrete).

4.2 Groundwater Sampling

As part of this Phase II ESI for Site M, a groundwater sampling program has been implemented to assess groundwater quality. Contaminants in groundwater at Site M may be present as a result of the contaminant leaching from historic fill material, leaching from hazardous materials or petroleum products released as part of the historic usage of Site M, releases from former on-site USTs, and releases from surrounding properties. The groundwater sampling plan included both the installation of temporary groundwater monitoring points, and sampling of existing monitoring wells to permit the collection groundwater samples for laboratory analyses.

Three (3) groundwater samples have been collected. The wells were sampled using a peristaltic pump and polyethylene tubing. Prior to sampling, the wells were purged using a submersible groundwater pump. The purge amount equaled 3 well volumes. Groundwater samples were containerized in laboratory-supplied, pre-preserved sample bottles. Each bottle was labeled with the project name, sample location, time of collection, and stored at a temperature below 4°C prior to delivery to the laboratory for analyses.

The groundwater samples were shipped to American Analytical Laboratories LLC of Farmingdale, NY for analysis of VOCs, SVOCs, TAL Metals, and PCBs. Additionally, samples were analyzed for NYCDEP Limitations for Effluent to Sanitary or Combined sewers.

5.0 RESULTS

The soil analytical data results were compared to the NYSDEC TAGM HWR-94-4046 Recommended Soil Cleanup Objectives (RSCOs). The TAGM provides a basis to determine soil cleanup levels at hazardous waste and spill sites when the Director of NYSDEC's Division of Environmental Remediation determines that cleanup of a site to predisposal conditions is not possible or feasible. The TAGM RSCOs were compared to Phase II ESI laboratory results to determine if the soil is contaminated. Laboratory summary pages are provided as Appendix B and Tables 1 through 4 present a summary of the soil analytical laboratory results. The soil boring logs describing the soil types and fill materials encountered are provided in Appendix A.

The groundwater analytical data results are summarized in Tables 5 through 8, and the laboratory summary pages are provided in Appendix B. The field duplicate sample was collected from the TWP installed in soil boring S-2. The results of the groundwater analyses were compared to the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, as well as the NYCDEP Limitations for Effluent to Sanitary or Combined and Storm Sewers (Limitations for Effluent to Sewers).

5.1 Soil Sample Results

Volatile Organic Compounds (VOCs)

The laboratory results for VOCs in soil are summarized in Table 1. Acetone above TAGM RSCO levels were detected in boring GP-1. Acetone is a common laboratory contaminant from sample handling rather than represent conditions in soil at the Site, although it possible to have residual acetone present from a previous site use. It is important to notice that a possibility for the presence of VOC and SVOC contaminants exists in the northern part of the Site, as indicated by the groundwater sampling results (GW-1). However, geologic the concentrations detected in groundwater are rather low and may be caused by migration from off-site sources.

Semi-Volatile Organic Compounds (SVOCs)

The laboratory results for SVOC analysis for soil are presented in Table 2. SVOCs above TAGM RSCO levels were detected in samples from locations GP-2, 7 and 6. At all locations SVOC contamination was concentrate at depth exceeding 12' BG. At location GP-1, the concentrations of SVOCs, although not in exceedence of the TAGM Soil Cleanup Objectives, have exceeded US EPA health-based criteria. The following SVOCs were detected in soil at concentrations exceeding the TAGM RSCOs :

- Benzo(a)anthracene (GP-2, GP-7, GP-6)
- Benzo(a)pyrene (GP-2 & GP-6)
- Benzo(b)fluoranthene (GP-2, GP-6 & GP-7)
- Benzo(k)fluoranthene (GP-2)

- Chrysene (GP-2, GP-6)
- Dibenzo(a,h)anthracene (GP-2)
- Indeno(1,2,3-c,d)pyrene (GP-2)

No other SVOCs were detected at concentrations exceeding the TAGM RSCOs in soil samples. The detected SVOCs include known or suspected carcinogens and systematic toxins. Provisions must be made to ensure proper protection of the workers during construction activities.

Metals

The laboratory results for metals analysis for soil are presented in Table 3. Metals at or above TAGM RSCO were detected in samples from the majority of borings throughout the site. The following metals were detected in soil at concentrations exceeding the TAGM RSCOs:

- Lead (GP-2 – above upper limit of normal industrial background)
- Mercury (GP-1, GP-2, GP-3, GP-4, GP-7, GP-10)
- Iron (all locations)
- Nickel (GP-2, GP-10, GP-6)
- Copper (GP-2, GP-4)
- Chromium (GP-1, GP-2, GP-3, GP-4, GP-6, GP-7, GP-9, GP-10)
- Cadmium (GP-5)
- Barium (GP-2, GP-4)
- Arsenic (GP-7)
- Zinc (all locations)

No other metals were detected at concentrations exceeding the TAGM RSCOs in soil samples. For some metals detected, including aluminum, calcium, lead, magnesium, manganese, potassium, and sodium, the TAGM RSCO is listed as "site background" only. Background concentrations of Iron vary widely, it's toxicity very low or none in most forms, and it should not be considered and contaminant of concern on this site.

The presence of the TAL metals on this site will require implementation of proper dust suppression and dust control systems during construction activities. Additionally, it is recommended to perform personnel exposure assessment during the excavating and blasting activities.

Polychlorinated Biphenyls (PCBs) and Pesticides

The laboratory results for the PCB analysis for soil are summarized in Table 3. PCBs were not detected in the soil samples analyzed.

Results for the pesticide analyses for soil are summarized in Table 4. The pesticide 4,4'-DDT was detected in soil samples from GP-4, considerably exceeding both exceed the TAGM RSCOs and US EPA health-based criteria.

A highly toxic pesticide Chlordane was detected at locations GP-3, GP-4 and GP-5 in concentrations exceeding TAGM RSCOs.

The pesticide Heptachlor was detected at location GP-3 in concentrations exceeding TAGM RSCOs.

Considering the fact that soil samples were collected as depth composites, a possibility exists for very high, localized concentrations of the above pesticides at shallow depth. A comprehensive field screening and sampling program must be implemented by the Contractor to protect workers from exposure to the pesticides during construction activities.

RCRA Hazardous Waste Characteristics

The laboratory results for the RCRA Hazardous Waste Characteristics for soil are summarized in Table 4. The soil samples were analyzed for flashpoint, reactivity and corrosivity. Results of these analyses revealed that the soil samples did not exhibit characteristics of RCRA hazardous waste.

Due to high concentrations of metals in soil samples, a composite sample was submitted for TCLP analysis for TAL Metals. No parameters were found to exceed regulatory limits for disposal as non-hazardous waste.

Summary of Soil Sampling Results

The laboratory results indicate that the soils at the Site contain elevated concentrations of SVOCs, pesticides and metals. The compounds detected are commonly present in fill materials located throughout New York City. The absence of high concentrations of target contaminants in the groundwater samples indicates the likelihood of relatively small-quantity localized releases of SVOC and pesticides on-site, as well as the presence of high levels of metals in the structural fill used to raise the surface elevation of the site. The NYSDEC *may* not permit reuse of soil excavated from the site due to the elevated concentrations of SVOCs and metals. Based on the results of the laboratory analysis, the subsurface material excavated during construction would likely be classified as non-hazardous waste if it is determined that off-site disposal is required.

Analysis for RCRA Characteristics revealed that site soils would not be considered RCRA hazardous waste.

5.2 Groundwater Sampling Results

Volatile Organic Compounds (VOCs)

The results of the VOC analysis for groundwater are presented in Table 5. The BTEX VOCs were detected in sample GW#1 (location GP-2 - North Side of the site) and benzene was detected in Sample GW#2 at a concentration exceeding the NYSDEC Groundwater Standards, but NOT exceeding NYCDEP Limitations for Effluent to Sewers. Since the groundwater at the site will not be used for human consumption and there are no sensitive ecological receptors in the area, the results indicate the possibility of direct discharge of the effluent of any dewatering operation into sanitary sewer (provided that all other NYCDEP criteria are met).

Semi-Volatile Organic Compounds (SVOCs)

A summary of the SVOC results for groundwater are presented in Table 6. SVOCs were NOT detected in any groundwater samples in concentrations exceeding either of the two referenced standards.

Metals

A summary of the metals results is presented in Table 7.

No metals were detected at concentrations exceeding applicable discharge limits, with the exception of Zinc. Processing of effluent water in sedimentation tanks is likely to lower the concentration of Zinc below regulatory limits.

Polychlorinated Biphenyls (PCBs)

A summary of the analytical results for PCB analysis is presented in Table 7. PCBs were not detected in the groundwater samples.

NYCDEP Sewer Discharge Requirements(excluding contaminant concentration listed above)

A summary of the laboratory results for these analyses is presented in Table 8. Laboratory analytical results for the groundwater samples revealed that the samples did not contain concentrations of hexavalent chromium, or exhibited pH that exceed the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers. The total suspended solids values were in excess of NYCDEC limits, indicating the need for sedimentation tanks as a part of the effluent treatment system on site.

Summary of Groundwater Sampling Results

The results of the laboratory analyses of groundwater revealed that in the northern section of the Site, slight VOC and metal contamination is present in the groundwater. However, none of the parameters (with the exception of Zinc and Total Suspended Solids(TSS)) exceed the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers criteria for discharge into sanitary or combined sewers. The elevated concentrations of Zinc, as well as elevated TSS values can be removed by the use of a sedimentation tanks prior to discharge into the sewer.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The following activities were performed for the Phase II ESI:

- Advancement of ten environmental soil borings;
- Collection of ten (10) grab and composite soil samples for laboratory analyses; and
- Collection of three (3) groundwater samples for laboratory analyses.

The following conclusions are based on field observations and laboratory results obtained from the investigation. Based on the conclusions recommendations are provided with regard to provisions for worker and community health and safety, as well as for handling and disposal of soil and groundwater encountered during the construction activities.

6.1 Soils

The laboratory results indicate that the soils at the Site contain elevated concentrations of SVOCs, pesticides and metals. The compounds detected are commonly present in fill materials located throughout New York City. The absence of high concentrations of target contaminants in the groundwater samples indicates the likelihood of relatively small-quantity localized releases of SVOC on-site, as well as the presence of high levels of metals in the structural fill used to raise the surface elevation of the site. The NYSDEC may not permit reuse of soil excavated from the site due to the elevated concentrations of SVOCs and metals. Based on the results of the laboratory analysis, the subsurface material excavated during construction would likely be classified as non-hazardous waste if it is determined that off-site disposal is required.

Prior to construction, the Contractor is required to prepare an Environmental Assessment Report (EAR), which shall include pre-construction characterization of all materials to be generated during construction. Based on our previous experience, determination as to reuse options will be made by NYSDEC based on sampling results of excavated and stockpiled material. The contractor should be prepared to handle the costs and logistics of off-site disposal of excavated contaminated soil.

The proposed excavation will extend into the bedrock, to depths in excess of the maximum depth achieved during the Phase II assessment. A possibility exists for contaminants to be present in the fractured bedrock below the Site M; however, based on results of this study the possibility of this is very low. The Contractor will be required to prepare a Site-Specific Health and Safety Plan and Site-Specific Soil Management Plan to address the handling and management of soil excavated from the Site during the construction activities. Due to the extent of excavation and proposed construction activities at the Site, off-site disposal of soil is expected. The laboratory results indicate that soil would likely be classified as non-hazardous waste.

6.2 Groundwater

The results of the laboratory analyses of groundwater revealed that in the northern section of the Site, slight VOC and metal contamination is present in the groundwater. However, none of the parameters (with the exception of Zinc and Total Suspended Solids(TSS)) exceed the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers criteria for discharge into

sanitary or combined sewers. The elevated concentrations of Zinc, as well as elevated TSS values can be removed by the use of a sedimentation tanks prior to discharge into the sewer.

6.3 Additional Investigation

The proposed excavation will extend into the bedrock, to depths in excess of the maximum depth achieved during the Phase II assessment. A possibility exists for contaminants to be present in the fractured bedrock below the Site M; however, based on results of this study the possibility of this is very low. Therefore, additional investigation is NOT recommended for this site.

6.4 Health and Safety

The Contractor is required to prepare a Site-Specific Health and Safety Plan and Site-Specific Soil Management Plan to address the handling and management of soil excavated from the Site during the construction activities. The presence of high concentrations of carcinogenic SVOCs, persistent pesticides such as 4,4'-DDT and Chlordane and heavy metals in the soil samples indicates the need to develop a site-specific Exposure Assessment, Personal Protective Equipment, Ambient Air Monitoring and Dust Control Plans.

ug/kg - micrograms per kilogram
 U - Analyte not detected at method detection level
 Lead - Average levels of lead in metropolitan areas or suburban areas or areas near highways usually range from 200 to 500 ppm.
 TAGM - Technical and Administrative Guidance Maintenance #4046 Recommended Soil Clean Up Objectives (RSCOs)
 Bold - Detection criterion equals or exceeds TAGM RSCOs

1.0 INTRODUCTION

Atlantic Environmental Solutions, Inc. (AESI) was retained by Solil Management LLC, to conduct a Phase I Environmental Site Assessment (“assessment” or “Phase I ESA”) of the property located within the Borough of Manhattan at 547-551 10th Avenue, New York, New York (“subject property” or “site”). The subject property is currently utilized as a Metropolitan Transit Authority construction yard. The property is improved with one structure, formerly utilized as an auto repair shop. The subject property has a rectangular footprint that is approximately 100 feet wide (along West 40th Street) and 200 feet long (along 10th Avenue), covering an area of approximately 20,000 square feet. Where it is not covered by structures, the lot is covered by asphalt, concrete and dirt. The subject property is identified on local tax maps as Block 1069, Lots 29 & 34. A Site Location Map is provided as Figure 1, and photographs of the property are included within Attachment A.

1.1 PURPOSE

The objective of the assessment is to develop an initial summary of the actual and potential environmental liabilities associated with the subject property through visual analysis, review of readily available information, and review of past and present land use in the vicinity. Specifically, AESI performed the assessment to identify the presence of hazardous substances, petroleum products, or conditions that indicate an existing or past discharge of hazardous substances or petroleum products onto the ground, ground water, surface water, or structures located on the subject property.

1.2 SCOPE OF ASSESSMENT AND METHODOLOGY USED

The Phase I Environmental Site Assessment was prepared in accordance with the general requirements developed by the American Society for Testing and Materials (ASTM) as presented in the *Standard Practice for Phase I Environmental Assessments* (E1527-05). This report provides a general characterization of the subject property based on readily available information obtained from: an inspection of the property, a review of available records, interviews with facility personnel, and interviews with relevant regulatory officials. This report provides documentation of the assessment, a summary of all identified areas of environmental concern, and recommendations for further action, where warranted.

AESI performed an inspection of the subject property on June 22, 2010. The site reconnaissance was performed to determine if there were obvious, visual indications of present or past activities which have, or could have, contaminated the site. The site inspection included a visual assessment of the exterior of the site structure and observations of neighboring properties made from the perimeter of the subject property.

1.3 LIMITATIONS, LIMITING CONDITIONS, AND EXCEPTIONS

This assessment included communication with relevant Federal, State, and local regulatory agencies, and a review of readily available historical information. It was not the purpose of this assessment to determine the actual presence, degree, or extent of contamination, if any, on the subject property. The assessment was not intended to identify all *de minimis* conditions that do not present a material risk of harm to public health or the environment that would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. In general, recognized environmental conditions requiring further investigation consist of those areas where a discharge is suspected to have resulted in the contamination of soil, groundwater, or surface water at concentrations above applicable State or Federal cleanup criteria.

The assessment did not include an evaluation for the presence or absence of radon, asbestos, freshwater wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, high voltage power lines, lead-based paint, lead in drinking water, or other non-scope considerations as defined by the ASTM standard practice E1527-05.

1.4 REASON FOR PERFORMING PHASE I

This assessment has been performed for the purpose of satisfying one of the requirements to qualify for the innocent land owner defense to Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability.

2.0 SUBJECT PROPERTY DESCRIPTION

2.1 LOCATION AND LEGAL DESCRIPTION

The subject property is located within the Borough of Manhattan at 547-551 10th Avenue, New York, New York. The subject property is bound to the west by a church, to the south by West 40th Street followed by a bus parking lot, to the east by 10th Avenue, followed by a multistory building occupied by Covenant House New York, to the north by West 41st Street followed by residential and commercial properties.

The subject property is identified on local tax maps as Block 1069, Lots 29 & 34. The subject property has a rectangular footprint that is approximately 100 feet wide (along West 40th Street) and 200 feet long (along 10th Avenue), covering an area of approximately 20,000 square feet. The subject property is currently utilized as a Metropolitan Transit Authority construction yard. The property is improved with one structure, formerly utilized as an auto repair shop. The lot is currently identified as 547-551 10th Avenue on the NYC Tax Database, but has historically included addresses from 537-551 10th Avenue. Refer to Figure 1 for general site location.

2.2 ENVIRONMENTAL SETTING

2.2.1 Regional Topography, Geology, and Hydrogeology

According to the United States Geological Survey (USGS), the subsurface geology in the area of the site consist of glacial till and outwash deposit sediments that overlie the Manhattan Shist, the uppermost bedrock unit at the site.

Saturated layers impacted by salt water intrusion are typically present in the overburden. It is generally inferred that the depth to the uppermost aquifer is greater than 30 feet at the surface of the bedrock/sediment interface.

2.2.2 Local Topography, Geology, and Hydrogeology

Site specific geologic and hydrogeologic characteristics/conditions have not been determined. However, it is anticipated that the site stratigraphy will be consistent with the regional lithology. The local topography is generally flat sloping gently to the south. The property elevation is approximately 23 feet above mean sea level (msl).

In a general way, the shallow ground water table typically conforms to surface topography (USEPA - EPA/625/6-90/016a, September, 1990).

2.2.3 Site Soils

According to soil boring logs prepared by PB (Parsons Brinckerhoff) Team (environmental consultant for the MTA) and reviewed by AESI, shallow soils at the property are characterized as urban fill material. The soils contain building debris, bricks, and cinders consistent with fill materials used to raise the elevation of sections of Manhattan adjacent to the Hudson River in the 18th Century.

2.3 DESCRIPTIONS OF STRUCTURES AND UTILITIES

The subject property is currently developed with one structure and is currently utilized as a Metropolitan Transit Authority construction yard. Historic records indicate that the property has been developed since at least 1890 with residential and commercial premises. Adjacent properties have been developed since at least 1890 with a coal yard and a Catholic Church. The subject property is currently developed with one (1) structure, a former automobile service shop and adjoining office area. The property is serviced by city water, sanitation and Consolidated Edison utilities. It is not known if these utilities are currently being used at the property by the MTA contractors operating the property as a construction yard.

2.4 ENVIRONMENTAL LIENS

Based on available information, no environmental liens are currently held against the subject property. No Federal Superfund liens were identified in the background information search.

2.5 CURRENT USES OF PROPERTY

2.5.1 Description of Operations

The subject property is currently utilized as a Metropolitan Transit Authority construction yard. The subject property was formerly used as an automobile repair shop and truck rental facility. The site reportedly also operated as a gas station until approximately June 1995 when the underground storage tanks were removed and disposed of.

2.5.2 Raw Materials

No raw materials were reported on the subject property during the site inspection, however, construction materials and petroleum products used in the maintenance of construction equipment were observed at that subject property. These materials are maintained on the site by the MTA contractors currently operating the site.

2.5.3 Wastes Generated (Annual Generator Reports and Manifests)

No hazardous wastes were observed at the subject property during the site inspection

2.5.4 Federal, State, and Local Permits and Registrations

No federal, state or local permits or registrations were provided to AESI as a result of inquiry.

2.5.5 Environmental Enforcement Actions

Based on our review of background information obtained from the correspondence and inquiries made by AESI, no environmental enforcement actions exist for the subject property. However, AESI are awaiting responses from regulatory authorities. If information is received showing an adverse environmental condition at the property, AESI will inform the client.

2.5.6 Previous Environmental Assessment or Investigation Reports

AESI reviewed sections of the *Phase II ESI Report for Site M* (subject property) prepared by PB Team for New York City Transit (the MTA); correspondence between the property owner and New York City Transit; correspondence between the property owner and the New York State Department of Environmental Conservation (NYSDEC); and photos and related documents from the removal of underground storage tanks (USTs) from the property in 1995.

In 1995, eight (8) USTs were reportedly removed from the property by Unico Service Corp., of Comack, NY. 83 tons of contaminated soil and 434 gallons of contaminated water were disposed of during the UST closure program. A discharge was reported to the NYSDEC on June 29, 1995 and Spill Case number 9503865 was assigned. It is AESI's understanding that a UST Closure Report was never submitted to the NYSDEC and that Spill Case 9503865 is still active. Please refer to Section 5 for Findings and Section 6 for Recommendations.

In 2005, PB Team, working on behalf of the Metropolitan Transit Authority New York City Transit, performed a Phase II Environmental Site Investigation at the subject property. The Phase II comprised a subsurface soil and groundwater investigation to determine if contamination in excess of standards was present prior to proposed use of the site in relation to the Number Seven (7) Subway Line Expansion. PB Team advanced ten (10) soil borings and collected three (3) groundwater samples from the site. Soil borings were advanced to depths ranging from 15 to 30 feet below ground surface. Soil Samples collected from the site were submitted for laboratory of volatile organic compounds (VOCs) and semi volatile organic compounds (SVOCs) per the NYSDEC Spill Technology and Remediation Series (STARS) List, Target Analyte List (TAL) Metals, pesticides, polychlorinated biphenyls (PCBs), asbestos and Resource Conservation and Recovery Act (RCRA) characteristics required for waste characterization and disposal. Groundwater samples were analyzed for STARS List VOCs and SVOCs, TAL Metals and PCBs.

Analysis of the soil samples identified elevated concentrations of SVOCs, pesticides and metals. Analysis of the groundwater samples reportedly identified Benzene, a VOC, and Zinc, a metal, at concentrations in excess of the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) criteria. However, review of the analytical results table in the Phase II shows that while benzene exceeds the criteria in one (1) sample, GW2, Zinc is not present in excess of the standards in any sample. Aluminum and Iron are shown to be present in excess of the TOGS criteria. AESI has not reviewed the laboratory data for these samples, only tables included in the section of the Phase II report supplied to AESI, so additional review of the data is recommended. Please see section 6 for Recommendations.

A portion of the Phase II Report has been provided in Attachment B.

2.5.7 Proceedings Involving Environmental Matters

Based on the review of background information obtained from the correspondence and inquiries made by AESI, no proceedings involving environmental matters were found for the subject property.

2.6 CURRENT USES OF ADJOINING PROPERTIES

The subject property is bound to the west a Catholic Church, to the south by West 40th Street, followed by a bus parking lot, to the east by 10th Avenue, followed by Covenant House New York, and to the north by West 41st Street, followed by residential and commercial properties.

3.0 RECORDS REVIEW, INTERVIEWS, AND CORRESPONDENCES

3.1 HISTORICAL USE INFORMATION

In order to determine the historic use of the property, AESI reviewed aerial photographs, historic topographic maps, and municipal files. Based on this review, the subject property is identified on local tax maps as Block 1069, Lot 34. The subject property is currently operated as a construction yard by MTA contractors for the Number 7 subway line expansion vacant, and was utilized as an automobile repair shop and gasoline filling station since at least 1950. Prior to that, the property was developed as a number of residential and commercial properties, including a “Tin Shop” (1950) and “Chine Laundry” (1911 until at least 1950) since at least 1890.

3.1.1 Fire Insurance Map Review

AESI contacted EDR Sanborn, Inc., the largest provider of historic fire insurance maps, requesting fire insurance maps for the site area. Fire insurance maps were available for the subject property for the years 1890, 1899, 1911, 1930, 1950, 1968, 1979, 1980, 1982, 1984, 1985, 1987, 1988, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 2001, 2002, 2003, 2004 and 2005. Copies of the Sanborn maps are provided in Attachment C of this report. The following is a brief summary of each year reviewed.

- 1890 - The subject property is identified as developed with five-story residential buildings identified as 537 through 551 10th Avenue. The adjacent property to the west is developed with a Catholic Church and Sunday School, a Furniture Factory and a coal yard. The adjacent property to the south across West 40th Street is developed as a brewery. The adjacent properties to the east across 10th Avenue are developed as a piano factory and four-story residential buildings. The adjacent properties to the north are developed as four and five-story residential buildings and a wall paper factory.
- 1899 – No significant changes are observed on the subject property or the adjacent property to the south. The coal yard and Furniture Factory previously identified on the adjacent property to the west are no longer present. No significant changes are observed on the property to the east. The Wall Paper Factory previously shown to the north has been replaced by six and seven-story residential buildings.
- 1911 – The property identified as 539 10th Avenue on the subject property is identified as a “Chine Laundry”. No other significant changes are noted on the subject property. The property to the west has been redeveloped as a Roman Catholic Church and Sunday School. No significant changes are observed on the adjacent properties to the south, east or north.
- 1930 – No significant changes are observed to the subject property or the properties to the west and north. The property to the south is no longer identified as a brewery and has become furniture and cold storage warehouses. The property located on the east corner of 10th

Avenue and West 41st Street has been demolished and redeveloped, but due to the quality of the map, the current use cannot be determined.

- 1950 – A gasoline filling station with four (4) USTs is identified on the subject property at addresses 547-551 10th Avenue. A “Tin Shop” is identified at 541 10th Avenue. No significant changes are observed on the properties to the west and north. Access routes to the Lincoln tunnel are observed on the property to the north. Filling Stations are shown on the north and south corners of the property to the east.
- 1968 – The buildings at addresses 539-545 10th Avenue have been demolished. The gasoline filling station remains on the northern portion of the subject property at 547-551 10th Avenue. No significant changes are observed on the properties to the west and north. The property to the south is not shown on the 1968 Sanborn Map. The property to the east is identified as a “Narcotics Rehabilitation Center”, with a filling station on the northern portion.
- 1979 – No significant changes are identified to the subject or adjacent properties subsequent to the 1968 Sanborn Map.
- 1980 - No significant changes are identified to the subject or adjacent properties subsequent to the 1979 Sanborn Map
- 1982 - No significant changes are identified to the subject or adjacent properties subsequent to the 1980 Sanborn Map
- 1984 - No significant changes are identified to the subject or adjacent properties subsequent to the 1982 Sanborn Map
- 1985 - No significant changes are identified to the subject or adjacent properties subsequent to the 1984 Sanborn Map
- 1988 – Due to the quality of the Sanborn Map, no observations can be made.
- 1990 – The subject property is shown to be improved with the filling station and a second building, denoted “Auto Repair”. The southern portion of the lot is shown as parking. No significant changes appear evident on the adjacent properties since the 1985 Sanborn Map.
- 1991 – No significant changes appear evident since the 1990 Sanborn Map.
- 1992 - No significant changes appear evident since the 1991 Sanborn Map.
- 1993 - No significant changes appear evident since the 1992 Sanborn Map.

The subject property was identified with an “E Designation” Site Listing. The E designation is typically assigned to site with a history of gasoline stations, USTs or other environmental discharges and requires that the owner of the site conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before issuance of a building permit by the Department of Buildings. In addition, AESI reviewed the Final Environmental Impact Statement (EIS) for the Hudson Yards/Clinton District. A portion of the EIS has been provided in Attachment B. The subject property was identified in the EIS as Site M, a proposed location of interest in the Number 7 Subway Extension. While the site does have an E designation, contaminants identified at the site are not considered hazardous, and this site is not included in Table 14.1 of the EIS, listing sites with hazardous materials. Please see Section 5 for Findings and Section 6 for recommendations.

3.3 INTERVIEWS AND CORRESPONDENCES

3.3.1 Interviews with Operator

Refer to Section 3.3.2 for further information regarding interviews conducted during the site inspection.

3.3.2 Interviews with Property Manager

AESI retained historic and current information from the subject property owner via an interview with an owner-representative. Applicable information obtained from the owner is incorporated into this report.

3.3.3 Interviews with Owner

Refer to Section 3.3.2 for further information regarding interviews conducted during the site inspection.

3.3.4 Interviews and Correspondences With Regulatory, Municipal, and Utility Officials

In addition to the EDR report, written or verbal requests for information were made to the following agencies to enhance and supplement the sources identified above:

- USEPA Region II - Freedom of Information (FOI);
- New York State Department of Environmental Conservation;
- New York City Department of Environmental Protection;
- New York City Clerk;
- New York City Building Department;
- New York City Health Department;
- New York City Fire Department;
- New York City Department of Finance;
- New York City Department of City Planning;

See Attachment G for copies of inquiry letters.

4.0 INFORMATION FROM SITE RECONNAISSANCE

AESI conducted a site inspection of the subject property on June 22, 2010. The site inspection observations are discussed in the following sections.

4.1 HAZARDOUS SUBSTANCES AND WASTES

4.1.1 Hazardous Substance Inventory and Description of Use

AESI identified 55 gallon drums in the building on the subject property. It is assumed that these drums are the property of the tenant on the site and contain petroleum liquids associated with the maintenance of construction equipment. A number of the drums were not labeled. Other containers of compressor lubricant and kerosene were observed on site. A compressed gas cylinder storage cage was also observed outside the building. No staining was identified in the vicinity of these materials. Please see Section 5 for Findings and Section 6 for Recommendations

4.1.2 Hazardous Waste Generation, Handling, and Disposal

No hazardous wastes were observed on the subject property during the site inspection.

4.1.3 Hazardous Substance and Unidentified Substance Containers

AESI identified unlabelled 55 gallons drums inside the building on the subject property. Please see Section 5 for Findings and Section 6 for Recommendations.

4.2 BULK STORAGE TANKS AND APPURTENANCES

4.2.1 Aboveground Tanks and Associated Piping

No evidence of aboveground storage tanks (ASTs) or associated piping were observed on the subject property during the site inspection.

4.2.2 Underground Tanks and Associated Piping

No evidence of underground storage tanks (USTs) was observed on the subject property during the site inspection. However, eight (8) USTs were reportedly removed from the property in 1995. At that time a discharge of petroleum was identified and reported to the NYSDEC. Contaminated soils and water were reportedly removed from the site. The NYSDEC spill case #9503865 remains active for the site. Also, during the site inspection, a MTA contractor working at the property reported that they had inadvertently accessed an underground vault, which may have

been a previously undiscovered UST. Please refer to Section 5 for Findings and Section 6 for Recommendations.

4.2.3 Storage Pads Including Drum Waste and Storage

Several fifty five (55) gallon drums and containers of lubricants and kerosene were observed on-site. Please refer to Section 5 for Findings and Section 6 for Recommendations.

4.2.4 Rail Spurs or Sidings

No rail spurs or siding were observed on the subject property during the site inspection.

4.2.5 Rail, Truck, or Other Loading and Unloading Areas

No dedicated truck loading or unloading areas were identified at the site. However, the property is currently used as a construction yard by contractors for the MTA during construction of the Number 7 subway line extension, so loading and unloading of construction materials is likely to take place on site. No obvious discharges or staining were noted during the site inspection.

4.2.6 Pump Stations, Sumps, and Pits

No pump stations, sumps or pits were observed during the site inspection.

4.2.7 Surface Lagoons and Impoundments

No surface lagoons or impoundments were observed on the subject property during the site inspection.

4.2.8 Chemical Storage Cabinets or Closets

One (1) chemical storage cabinet maintained by the tenant was observed on the subject property during the site inspection. AESI was unable to access the cabinet. No staining was observed in the vicinity of the cabinet.

4.3 DRAINAGE SYSTEMS AND AREAS

4.3.1 Surface Water Bodies

No surface water bodies were observed during the site inspection.

4.3.2 Floor Drains or Trenches and Piping

No floor drains or trenches and piping were observed during the site inspection.

4.3.3 Process Area Sinks and Piping

No process area sinks were identified during the site inspection.

4.3.4 Sanitary Sewer Collection Systems

The property is likely connected to the municipal sewer system. However, the site building is only used for storage and the sanitary restrooms are non-functioning. Portable restroom facilities are in place at the site for construction workers.

4.3.5 Septic Systems and Leach Fields

There were no septic systems or leach field observed during the site inspection.

4.3.6 Seepage Pits and Dry Wells

No seepage pits or dry wells were observed during the site inspection.

4.3.7 Storm Water Detention Ponds and Fire Water Ponds

No storm water detention ponds and fire water ponds were identified during the site inspection.

4.3.8 Drainage Swales and Culverts

No drainage swales or culverts were identified during the site inspection.

4.3.9 Roof Leaders Where Process Operations Vent To Roof

No roof leaders where process operations vent to the roof were observed during the site inspection.

4.4 DISCHARGE AND DISPOSAL AREAS

4.4.1 Solid Waste Generation and Disposal and Dumpsters

One (1) dumpster was identified on the subject property during the site inspection. The dumpster is utilized by the tenant for the disposal of construction waste. No staining was identified in the vicinity of the dumpster.

4.4.2 Sanitary and Process Waste Generation and Discharge Points

No sanitary or process waste generation and discharge points were observed during the site inspection.

4.4.3 Underground Piping, Including Industrial Process Sewers

No underground piping was observed during the site inspection and no industrial processes are conducted on the subject property.

4.4.4 Waste Piles

No waste piles were observed during the site inspection.

4.4.5 Landfills or Landfarms

No landfills or landfarms were observed on the subject property during the site inspection.

4.4.6 Open Pipe Discharges

No open pipe discharge points were observed on-site.

4.5 BUILDING INTERIOR AREAS (with a potential for discharge to the environment)

4.5.1 Waste Treatment Areas

No waste treatment areas were observed on the subject property during the site inspection.

4.5.2 Heating Units

No heating units were observed in the on site structure.

4.5.3 Sumps

No sumps were observed on the subject property during the site inspection.

4.6 OTHER SITE SPECIFIC AREAS OF CONCERN

4.6.1 Electrical Transformers and Capacitors

No electrical transformers or capacitors were observed during the site inspection.

4.6.2 Areas of Stressed Vegetation, Discolored Areas, and Odors

No stressed vegetation, discolored areas, or odors were observed on the grounds of the subject property during the site inspection.

4.6.3 Compressor Vent Discharges

No compressors were observed on the subject property during the site inspection.

4.6.4 Non-Contact Cooling Water Discharges

No non-contact cooling water discharges were observed on the subject property during the site inspection.

4.6.5 Active Or Inactive Production, Monitoring or Irrigation Wells

Three (3) monitoring wells were identified during the site inspection. These wells may have been installed as part of the PB Phase II, but AESI has no further information regarding their construction or use. Please see Section 5 for Findings and Section 6 for Recommendations.

4.6.6 Weighing Stations

No weighing stations were observed on the subject property during the site inspection.

4.6.7 Hydraulic Lifts

In-ground hydraulic lifts were observed within the former service building at the site. Please see Section 5 for Findings and Section 6 for Recommendations.

4.7 ADDITIONAL SERVICES

No additional services were requested by the client.

5.0 FINDINGS

5.1 DE MINIMIS ENVIRONMENTAL CONDITIONS

Conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies are deemed de minimis conditions by the ASTM standard.

- No de minimis conditions were discovered by AESI during the inspection.

5.2 HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS

Historical Recognized Environmental Conditions are conditions that in the past would have been considered a recognized environmental condition, but which may or may not be considered a recognized environmental condition currently.

- No Historical Recognized Environmental Conditions were discovered by AESI during the inspection.

5.3 RECOGNIZED ENVIRONMENTAL CONDITIONS

Recognized Environmental Conditions (REC) are those constituting the presence or likely presence of any hazardous substance or petroleum products under conditions that indicate an existing release, a past release, or material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.

- The subject property was identified with an “E Designation” Site Listing. The (E) designation requires that the owner of the site conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before issuance of a building permit by the Department of Buildings. In addition, AESI reviewed the Final Environmental Impact Statement (EIS) for the Hudson Yards/Clinton District. The subject property is identified as Site M in the EIS and is a proposed site for the 10th Avenue Number 7 Line Subway Station. Chapter 14 of the EIS includes a listing of properties deemed to have hazardous waste issues AESI has reviewed this listing and the subject property is not listed as having hazardous waste issues. The subject property is identified as Site M in the EIS. Chapter 14 of the EIS has been provided in Attachment B. The subject property would require sampling and screening of volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs) and metals prior to development on the property.
- The subject property has an open Spill Case #9503865 dating back to the removal of USTs from the former service station in 1995.

- During the site inspection a contractor on the site suggested that an Underground Storage Tank potentially remained in the ground at the subject property.
- Soil and Groundwater contamination are noted in a previous Phase II conducted as part of the Hudson Yards development project and Number 7 Subway Line extension. Three (3) Monitoring Wells are located at the subject property, possibly installed as part of the Phase II.
- Hydraulic lifts are located within the former service area on the subject property.
- Drums/containers of compressor lubricant and kerosene, gas cylinders and a dumpster are located on the subject property.

6.0 RECOMMENDATIONS

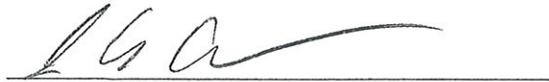

AESI has performed a Phase I Environmental Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 of the subject property located at 547-551 10th Avenue, New York City, New York. AESI has the following recommendations based on the assessment:

- The subject property was identified with an “E Designation” Site Listing. The (E) designation requires that the owner of the site conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before issuance of a building permit by the Department of Buildings. AESI recommends the performance of a subsurface investigation to collect soil samples for analyses of VOCs, SVOCs and Metals to address the “E Designation” Site Listing for the subject property prior to any redevelopment of the subject property.
- The subject property has an open Spill Case #9503865 dating back to the removal of USTs from the former service station in 1995. AESI recommends that a Phase II subsurface investigation be conducted at the subject property to delineate any soil or groundwater impacts in the vicinity of the former USTs and preparation of a Site Investigation Report per the requirements of the NYSDEC. At a minimum, the Phase II investigation should include a soil boring program of six to ten borings in the area of the former USTs, with borings advanced to at least ten (10) feet below the invert of the former tanks.
- During the site inspection a contractor on the site suggested that an Underground Storage Tank potentially remained in the ground at the subject property. AESI recommends the use of Ground Penetration Radar (GPR) determine if an additional UST is present at the site.
- Soil and groundwater contamination is mentioned in a previous Phase II investigation by Parsons Brinckerhoff conducted as part of the Hudson Yards development project and Number 7 Subway Line extension. Three (3) Monitoring Wells were also identified at the site, possibly installed as part of the Phase II. AESI recommends that a Phase II soil and groundwater sampling program be performed to document the presence of historic fill related contaminants at the site and that the monitoring wells be properly abandoned. The sampling program should consist of at least four (4) borings to confirm the presence of non-native fill material at the site and show that these contaminants are ubiquitous across the site and are unrelated to site operations.
- Hydraulic lifts are located within the former service area on the subject property. AESI recommends investigation of the soil in the area of the hydraulic lifts, and soil sampling to determine if there is any contamination associated with them.

- AESI recommends removal and proper disposal of the drums, containers of compressor lubricant and kerosene, gas cylinders, and dumpster belonging to the tenant (MTA construction yard).

7.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONALS

The preceding Phase I Environmental Assessment was prepared by the undersigned environmental professionals in accordance with the ASTM - Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (E1527-05) and the requirements for performing a Preliminary Assessment under N.J.A.C. 7:26E-3.1. The undersigned environmental professionals are employed by Atlantic Environmental Solutions, Inc., an environmental consulting firm located in Hoboken, New Jersey, and are qualified to conduct Phase I environmental assessments.

Jeffrey W. Anderson, CHMM

Chapter 14: Hazardous Materials

A. INTRODUCTION AND PRINCIPAL ISSUES

This chapter assesses the potential presence of subsurface contamination (soil, soil gas, groundwater, bedrock) and the potential presence of hazardous materials in surface structures containing contaminated materials that could be affected by the construction and operation of the elements of the Proposed Action as described in Chapter 2, "Description of the Proposed Action." It also addresses the potential impacts on worker safety, public health, and the environment from potential contaminants/hazardous materials and identifies management practices that would be incorporated into the Proposed Action to preclude significant adverse impacts during construction. The potential for operational impacts from hazardous materials following construction is also considered in this chapter.

Contamination conditions were assessed for all of the components of the Proposed Action where construction activities would occur, to determine if hazardous materials are present. Depending upon the nature of construction activities that would occur at or near a project element, one or more different types of hazardous materials assessment methods were performed in order to further evaluate the potential for hazardous materials. These assessment methods included: an Area Hazardous Materials Screening Study; No. 7 Line Extension (Alignment) Geotechnical Boring Screening; Phase I Environmental Site Assessments; Phase II Environmental Site Assessments or other appropriate site investigations. For all projected and potential development sites identified within the proposed area to be rezoned, a preliminary screening assessment pursuant to Title 15 of the Rules of the City of New York, Chapter 24, Section 4 was done.

The CEQR Technical Manual defines a hazardous material (contamination) as any substance that poses a threat to human health or to the environment. Such substances include but are not limited to: metals; volatile organic compounds (VOCs), commonly found in petroleum products, solvents; semi-volatile organic compounds (SVOCs), typically associated with fuel oil, coal, and ash; and polychlorinated biphenyls (PCBs), usually associated with transformers and utilities. Hazardous materials also include substances used in building materials and fixtures, such as asbestos-containing material (ACM), lead-based paint (LBP), and mercury. The presence of hazardous materials does not necessarily indicate a threat to human health and/or the environment; a means of an exposure pathway, a receptor, and an unacceptable dose must also be present to cause a threat.

During construction, hazardous materials could be disturbed through excavation of soil and consolidated rock, extraction of groundwater, or the demolition/renovation of ancillary structures. The most likely routes of human exposure from the hazardous materials evaluated are the inhalation of VOCs, the ingestion of particulate matter containing SVOCs or metals, or dermal (skin) contact with hazardous materials that can be released during soil-disturbing activities. Chapter 23, "Construction Impacts," describes likely construction methods, sequencing, and impacts that could be generated by the Proposed Action.

1. Principal Conclusions

The Proposed Action is not anticipated to result in any significant adverse impacts with respect to hazardous materials.

The initial evaluation of hazardous materials was completed through performance of an Area Hazardous Materials Screening Study (AHMSS). This broad screening method identified potentially contaminated sites (PCSS) that may affect implementation of the Proposed Action. Subsequent to this evaluation, further screening and assessment methods were employed on a project element basis to

TABLE 14-1
INVESTIGATION FINDINGS

Location	AHMSS and Phase I ESA Findings	Phase II ESA or Other Appropriate Investigation Findings	Management Measures
No. 7 Subway Extension			
Alignment (including Intermediate and Terminal Stations)	Petroleum releases, historical uses (e.g., foundries and coal yards) and the presence of Serpentine in bedrock	Field screening of over 100 geotechnical soil borings and laboratory results for three (3) environmental soil borings revealed isolated petroleum impacts to soil and groundwater. Serpentine bedrock present between West 26th Street and West 29th Street beneath Eleventh Avenue.	Isolated petroleum impacts to soil and groundwater would require management.
Site A	On-site: petroleum contamination, historical uses (e.g., iron works, junkyard), historic placement of fill. Off-site: petroleum releases and historical uses (e.g., iron foundries, oil storage and charcoal works).	Five (5) soil borings were taken and one (1) temporary monitoring well was installed. Four (4) soil samples and one (1) groundwater sample revealed concentrations of SVOC and metals, consistent with urban fill.	Fill material underlying the site contains concentrations of SVOCs and metals that require management.
Site L	On-site: petroleum releases, historical uses (e.g., iron works, paint shop, coal yard and bus terminal), historic placement of fill. Suspect LBP, ACM and PCB-containing material present in existing building. Off-site: petroleum spills and historical uses (e.g., coal yards, print shop and gas stations)	Twelve (12) soil borings were taken and three (3) temporary monitoring wells were installed. Twenty-four (24) soil samples and three (3) groundwater samples revealed concentrations of SVOCs and metals, consistent with urban fill.	Fill material underlying the site contains concentrations of SVOCs and metals that require management.
Corona Yard	On-site: The site is above an EPA-designated sole-source aquifer (Lloyd Sand Member). Historical use as a railyard and historic placement of fill. Off-site: automotive repair and wreckage facilities, filling stations and automobile scrap yards) and petroleum releases.	Review of logs for six (6) geotechnical soil borings advanced at the site and a published reference revealed that the Lloyd Sand Member does not underlie Corona Yard. LIRR soil investigation revealed presence of localized petroleum impacts and the fill containing SVOCs that are indicative of urban fill.	LIRR will manage petroleum impacts, consistent with NYSDEC requirements. SVOCs in fill would require management.

TABLE 14-1 (CONTINUED)
INVESTIGATION FINDINGS

Location	AHMSS and Phase I ESA Findings	Phase II ESA or Other Appropriate Investigation Findings	Comments
Truck Marshalling Route	On-site: Historical use as a coal yard and presence of railroad tracks. Off-site: Petroleum releases, historical uses (e.g., consolidated gas works, iron yard, a coal house, machine shop and coal yard).	Six (6) soil borings were taken and four (4) monitoring wells were installed. Fourteen soil (14) and four (4) groundwater samples revealed concentrations of SVOCs and metals that are consistent with urban fill.	Fill material underlying the site contains concentrations of SVOCs and metals that require management.
Convention Center Marshalling Yard	On-site: Historical uses (e.g., railroad operations, machine shops and trailer storage). Suspect ACM, LBP and PCB-containing equipment present in buildings. Off-site: Releases of gasoline and dielectric fluid, historical uses (e.g., railyard, garages with USTs, auto repair shops and machine shops).	Six (6) soil borings were taken and four (4) monitoring wells were installed. Fourteen (14) soil and four (4) groundwater samples revealed concentrations of SVOCs and metals that are consistent with urban fill.	Fill material underlying the site contains concentrations of SVOCs and metals that require management.
Intervening Streets	Historical uses (e.g., railroad, freight operations, manufacturing gas, storage of hazardous materials and documented petroleum releases)	Eight (8) soil borings were taken and six (6) monitoring wells were installed. Eighteen (18) soil and twelve (12) groundwater samples revealed concentrations of SVOCs and metals that are consistent with urban fill.	Fill material underlying the site contains concentrations of SVOCs and metals that require management.
Caemmerer Yard			
Caemmerer Yard West	On-site: Historical and current use as a railyard may have resulted in releases of petroleum, metals, PCBs, and applications of pesticides or herbicides. A statistical sampling program is required to characterize hazardous materials from anthropogenic activities, which are random. Off-site: historical uses (lumber yard, motor freight storage and garage with gasoline tanks)	Fifty-seven (57) soil borings were taken and twenty-two (22) monitoring wells were installed. Two-hundred soil (200) and twenty-two (22) groundwater samples revealed localized petroleum contamination in soil and groundwater. Concentrations of SVOCs and metals, consistent with urban fill, were detected. The results of the Phase II ESA validate the statistical sampling approach applied to the site.	Isolated petroleum impacts to soil and groundwater require management. Fill material underlying the site contains concentrations of SVOCs and metals that require management.
Caemmerer Yard East	On-site: Historical and current use as a railyard may have resulted in releases of petroleum, metals, PCBs, and applications of pesticides or herbicides. A statistical sampling program is required to characterize hazardous materials from anthropogenic activities, which are random. Off-site: historical uses (metal works, junk yard, auto repair shop, gasoline station railroad operations)	Thirty-four (34) soil borings were taken and four (4) monitoring wells were installed. One-hundred seven (107) soil and four (4) groundwater samples revealed concentrations of SVOCs and metals, consistent with urban fill in soil and groundwater. The results of the Phase II ESA validate the statistical sampling approach applied to the site.	Fill material underlying the site contains concentrations of SVOCs and metals that require management.

the 2025 analysis year. Refer to Chapter 23, "Construction Impacts," for a detailed description of the construction activities.

Hazardous materials are often encountered and are of the greatest concern during construction. Construction activities of the following Proposed Action elements are expected to occur prior to 2010 and were evaluated for potential hazardous material impacts during the construction and operational periods:

- No. 7 Subway Extension, including the subway alignment, two stations, ancillary facilities to support the operation, and a storage area at Corona Yard;
- Development generated as a result of the proposed zoning map and text amendments;
- Construction of the Multi-Use Facility over the western portion of the Caemmerer Yard;
- The Convention Center Expansion, including the hotel and the demolition of the existing Quill Bus Depot and relocation of the facility to the southern portion of the Caemmerer Yard, the construction of the Marshalling Yard between West 33rd Street and West 34th Street, and the potential construction of the truck tunnel connecting between the Marshalling Yard and the expanded Convention Center;
- Construction of the southern portion of the Midblock Park and Boulevard System (Block 705 Lot 53 and 54) and the 950-space underground parking garage; and
- Relocation and consolidation of the NYPD Tow Pound and Department of Sanitation New York (DSNY) Facility to within the Hudson Yards Project area (Block 675) (not a project element, but would be accommodated by the Proposed Action).

The 2025 analysis year includes the following elements:

- Remaining development generated as a result of the proposed zoning map and text amendments; and
- Construction of the remaining portion of the Midblock Park and Boulevard System sites.

2. Environmental Assessment Methods

Depending upon the nature of the project element, one or more of the following hazardous materials assessments was performed to properly evaluate the potential for hazardous materials:

- Area Hazardous Materials Screening Survey (AHMSS);
- Phase I Environmental Site Assessments (ESAs) or other appropriate non-intrusive inquiry and investigation;
- Phase II ESAs or other appropriate site investigations;
- Preliminary Assessment (Projected and Potential Development Sites); and
- No. 7 Line Extension (Alignment) Geotechnical Boring Screening.

3. Determining Whether a Hazardous Materials Assessment is Appropriate

The potential for impacts related to hazardous materials can occur when: elevated (i.e., above regulatory guidance values) levels of hazardous materials exist on a site and an action would create pathways for exposure, to either humans or the environment; or an action would introduce new activities or processes using hazardous materials and the risk of human or environmental exposure would be increased. In general, however, it can be difficult to ascertain if a site contains elevated

U.S. Environmental Protection Agency (EPA) and New York State Department of Environmental Conservation (NYSDEC) databases reviewed for these assessments included the following:

- National Priority List (NPL)
- Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) list
- Resource Conservation and Recovery Act (RCRA) hazardous waste treatment, storage, and disposal facilities list
- Inactive Hazardous Waste Disposal Sites list
- Major Oil Storage Facilities list (sites storing more than 400,000 gallons of petroleum products)
- Hazardous Waste Generators and Transporters list
- Historic Utility Facilities
- Chemical and Petroleum Bulk Storage Facilities list (under 400,000 gallons storage capacity)
- Hazardous Material Spills database
- Toxic Release Inventory Sites list
- Air and Toxic Wastewater Discharge Sites
- Civil Enforcement Docket sites (sites involved in environmental litigation).

ASTM E 1527-00 is the industry standard for environmental site assessments. The ASTM standard specifies the radial distances from each site for which database searches are performed.

The site reconnaissance included an assessment of the following elements: current use of building; type of heating system; current water and sanitary connections; the presence of vent pipes and fill caps associated with petroleum storage tanks; electrical transformers; areas of dumping or filling; potential ACM; potential LBP; chemical storage; groundwater monitoring wells; and fluorescent light fixtures. Reasonable efforts were made to inspect each property; however, many property owners have not granted site access.

Some properties in which temporary and/or permanent easements would be acquired were not assessed through a Phase I ESA, either because the easements would not be effected by construction, would be insignificant in size or would not likely have surface penetration. For example, the easement that would be required for the portion of the alignment on the curve from West 41st Street to Eleventh Avenue is below private property, approximately 100 feet below grade, and surface penetration would not occur; there is limited potential for encountering hazardous materials in this and comparable situations.

c) Phase II ESA

Phase II ESAs or other appropriate site investigations were performed as appropriate for sites where the AHMSS, Phase I ESAs, or other non-intrusive efforts revealed situations requiring intrusive confirmations of the potential presence of hazardous materials. Phase II ESAs typically include the collection of soil, soil gas, and/or groundwater samples and subsequent laboratory analyses for parameters of concern (e.g., VOCs, SVOCs, PCBs, and metals). The results of the laboratory analysis and on-site observations are used to: confirm the presence or absence of subsurface contamination that was suspected as a result of the identified REC; identify the physical and chemical characteristics of the subsurface; assist in determining requirements for the HASP which would help ensure adequate community and worker health and safety; and evaluate handling, management, and disposal requirements of, as examples, excavated soil and dewatering water.

Phase II ESAs or other appropriate site investigations have been completed for properties owned by the Project Sponsors (e.g., Caemmerer and Corona Yards, existing Convention Center, existing Quill Bus Depot, Truck Marshalling Route, Convention Center Marshalling Yard, along the Alignment) and at two acquisition properties (Site A, Site L). In the case of properties not owned by or accessible

presence of hazardous materials. Sanborn Maps were used to acquire this type of historical information. The Convention Center, the Yale trucking property (Block 685), the site of the proposed Convention Center Marshalling Yard, and Caemmerer and Corona Yards were assessed through Phase I ESAs. Phase II ESAs or other appropriate investigations were carried out for portions of the existing Convention Center, the site of the Proposed Convention Center Marshalling Yard, the existing Quill Bus Depot site, and the MTA Caemmerer and Corona yards. Section H, "Summary of Management Measures" includes information regarding the proposed management approach for hazardous material situations.

d) Alignment Conditions (No. 7 Subway Extension)

The proposed alignment for the No. 7 Subway Extension was initially evaluated through the AHMSS, which provided a broad view of the environmental conditions within the area of the alignment, and which aided in the identification of PCSs. To further investigate conditions along the alignment, a 200-foot buffer (measured outward from the centerline of the proposed alignment) was established to ascertain whether PCSs were within the 200-foot buffer. PCSs that were within this buffer were further evaluated by reviewing the information provided in the regulatory agency database and/or by reviewing subsurface data obtained through environmental screening of geotechnical borings performed in the area of the PCS of concern. In addition, areas along the alignment where extensive subsurface intrusion is proposed (e.g., station locations) were evaluated to determine whether, and to what extent, investigations could be required along the proposed alignment.

Based on the AHMSS and information from the Phase I ESAs, three environmental alignment borings were advanced to evaluate potential contaminants (e.g., VOCs, PCBs, and metals). The results of the investigation are included in Section C, "Existing Conditions". Potential Contaminants of Concern

The contaminants described in this section are commonly found in urban settings, and for certain materials (e.g., metals), background concentrations can be expected from both natural and anthropogenic sources. Where concentrations exceed regulatory thresholds, an analysis of potential environmental and health effects is required; the need for management could be necessary.

In order to determine such concentrations, environmental sampling and laboratory analysis are required. Laboratory analytical results are used to determine whether the media tested (e.g., soil, soil gas, groundwater, building materials) are considered hazardous and the proper handling and disposal procedures. During construction, hazardous materials would be managed or isolated to protect public health and the environment. Construction measures, including the implementation of site-specific HASPs, dust control measures, contaminated soil and groundwater management plans, and abatement of hazardous building materials prior to construction, would aid in the avoidance of adverse health impacts to workers and the general public. Management measures, including the means for handling specific types of contaminated material, are discussed further in Section H.

The locations of potential contaminants that could be encountered through the Proposed Action can be categorized as being either subsurface (e.g., soil, soil gas, groundwater, consolidated rock) or above grade (e.g., building materials) contaminants. Subsurface contaminants include but are not limited to VOCs; SVOCs; metals; PCBs in soil and groundwater; and asbestos, which can occur naturally in serpentine rock. Above grade contaminants include, but are not limited to ACM, LBP, PCB-containing equipment, and mercury.

e) Subsurface Contaminants (Soil, Soil Gas, Groundwater and Consolidated Rock)

The subsurface could contain contaminants associated with historical uses and prior releases. Certain contaminants, such as petroleum products, could have been released from surface spills or from leaking petroleum storage tanks. Other contaminants, such as VOCs, SVOCs, metals, and PCBs could have resulted from spills at former rail yards and other types of industrial or commercial

The results of the investigation were compared to Phase I expectations and standards and reference values published by the EPA, NYSDEC and DEP, as appropriate. This comparison was used to draw conclusions on the type of management measures that would be required during the construction and operational phases of the Proposed Action. Preliminary Screening Assessment (Rezoning Area)

For all projected and potential development sites identified within the rezoning area, a preliminary screening assessment was conducted pursuant to Title 15, Rules of the City of New York, Chapter 24, Section 4. The conclusion of the preliminary screening assessment is that (E) Designations are warranted for properties expected to experience redevelopment as a result of the proposed rezoning and which may contain the potential for hazardous materials contamination. For these sites, a Phase I Environmental Site Assessment (ESA), pursuant to Section 24-05, would not be required. The (E) Designation ensures that no significant adverse impact would result from the proposed rezoning, because the City requires appropriate measures be undertaken to mitigate potential hazardous materials impacts prior to construction activity. The preliminary screening assessment conducted for the Proposed Action included a review of historical and current land uses of the tax lot(s) included within the projected and potential development sites; adjacent (within 400 feet) lots were assessed as well. Regulatory agency databases were also reviewed for the listing of the aforementioned tax lots listings within the databases.

d) Geotechnical Boring Screening (Along No. 7 Subway Extension Alignment)

Geotechnical borings were advanced along the proposed alignment of the No. 7 Subway Extension in order to assess subsurface conditions that could affect the engineering, design, and construction of the proposed subway extension. Samples of soil and bedrock were collected for assessment of physical properties, including the presence of asbestos fibers found naturally in serpentine rock. During this effort, soil samples from the alignment borings were field screened for hazardous materials such as VOCs, using direct-read instruments such as a photoionization detector (PID). Additionally, information obtained from the screening of the borings aided in the evaluation of PCSs identified in the AHMSS and helped to determine whether further environmental investigation (e.g., Phase II ESIs) is necessary.

4. Application of Assessment Methods

The assessment methodology used to evaluate the potential presence of hazardous materials was specific to the project element; the following paragraphs discuss the assessments implemented for each of the project elements.

a) Acquisition Properties

Acquisition properties are those that would be acquired by the City and other Project Sponsors as part of the Proposed Action and include: properties proposed for the Midblock Park and Boulevard System; Site A (site for Tunnel Boring Machine (TBM) access); Site L (Tenth Avenue Station); those properties proposed for supportive uses (e.g., laydown areas, Sites J, M, N) for the No. 7 Subway Extension; and, those properties to be acquired as part of the Convention Center Expansion. Each of these properties was assessed through a Phase I ESA. Site L and a portion of Site A were also assessed through Phase II ESAs, which further investigated the RECs identified through the Phase I ESAs. The area beneath the Midblock Park and Boulevard System properties to be used for the underground parking facility was included among the properties assessed. Properties to be acquired as part of the Convention Center Expansion were also assessed through a Phase I ESA and Phase II ESAs.

Site access for Phase I ESAs was initiated at each of the proposed acquisition properties through letters to property owners requesting permission to visit the property. The letters were sent via United States Postal Service (USPS) certified mail, with return receipt requested. The property owner

Polychlorinated Biphenyls (PCBs)

Commonly present in dielectric fluid from transformers and feeder cables, PCBs are of concern at rail yards, train maintenance facilities, and electric transformer locations where leakage into soil could have occurred. Occasionally, PCB-containing waste oils were applied in rail yards to limit vegetation; these waste oils were also used on coal piles and dirt roads as a dust suppressant.

Pesticides and Herbicides

These compounds are used to control rodents, insects, and vegetation at undeveloped properties or along railroad tracks. Pesticides and herbicides are generally not widespread in subsurface urban soils and groundwater.

Cyanide

Cyanide was produced as a waste product at MGP sites. In many instances, MGP waste products were disposed of on-site by using the waste as landfill of low-lying areas of the site.

Naturally Occurring Contaminants in Soil Gas

In addition to contaminants from releases of hazardous materials, naturally occurring contaminants, such as radon and methane, may be present in soil gas. Radon is a colorless, odorless radioactive gas that results from the natural breakdown of uranium minerals in soil, rock, and water. If present, it can concentrate in buildings, entering through cracks and other penetrations of a building foundation. Radon concentrations vary City-wide, reflecting subsurface conditions.

Methane, produced by the decomposition of organic matter from natural and anthropogenic sources, may also be present as a result of land filling areas that were formerly inundated. Methane, in itself, is not considered toxic; however, it can be potentially explosive when present in significant concentrations. When present with other VOCs, methane can pose a health and safety risk.

Naturally Occurring Asbestos (NOA)

Naturally occurring asbestos (NOA) could be present in consolidated rocks including Serpentine, Talc Schist, and Chlorite Schist. Asbestos fibers are potentially harmful if they become airborne and are inhaled.

f) Above-Grade Contaminants (Building Materials)***Asbestos-Containing Materials (ACM)***

Building materials used in the construction of existing buildings could contain asbestos. Asbestos fibers are potentially harmful if they become airborne and are inhaled. The EPA prohibited the use of asbestos in spray-on fireproofing in 1972 and in thermal insulation in 1978. In addition, normally non-friable asbestos-containing products (i.e., those that when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure) that are typically stable could be damaged during the abatement process, and would be considered friable ACM thereafter.

Lead-Based Paint (LBP)

Buildings and other structures constructed or re-painted prior to 1960 may contain LBP. It has been determined that dust from LBP may cause learning disabilities and other adverse health effects when inhaled or ingested. Although the use of LBP in residences was banned by the Consumer Products Safety Commission in 1978 and by New York City in 1960, the use of LBP was common in New York City prior to this ban.

PCB-Containing Equipment

PCBs are present in transformers, electrical feeder cables, hydraulic equipment, and fluorescent light ballasts that were manufactured prior to 1978. Disposal of such items must be in accordance with

Note: mg/l = milligrams per liter in leachate generated from toxicity characteristic leaching procedure.

c) Soil Reference Values

Except for specific contaminants and circumstances, neither the federal nor the New York State governments have promulgated a comprehensive set of numerical standards for the evaluation of environmental impacts caused by chemical contaminants in soils. Therefore, guidance or reference values are used to determine whether soils require management. The reference values have not undergone the rigorous analyses required for regulatory standards and, in many cases, might not be applicable to the situations found in the vicinity of the Proposed Action. In general, contaminants detected in soils are compared to the NYSDEC Division of Hazardous Waste Remediation's Technical and Administrative Guidance Memorandum (TAGM) #4046, "Determination of Soil Cleanup Objectives and Cleanup Levels," January 1994 (amended in December 2000). TAGM #4046 addresses contaminants in soil (i.e., VOCs, SVOCs, metals, PCBs and pesticides and herbicides) from any potential source, and includes guidance values for chemicals of concern.

d) Water Standards and Regulations

Contaminated groundwater could be encountered during excavation or dewatering activities. The NYSDEC has promulgated drinking water standards and uses them as reference values for groundwater. These potable groundwater standards (also known as Class GA Standards) are among the most stringent in the nation. Although these standards are intended for public drinking water

In all cases, an exposure assessment would be performed prior to demolition and construction to assess whether lead exposure would be likely to occur during demolition or renovation activities. If the exposure assessment indicates the potential to generate airborne dust or fume lead levels exceeding health-based standards, a higher personal protection equipment standard would be employed to counteract the exposure. In addition, a different application of work practices could be required to protect workers and the public. This will be done in accordance with NYCT 12L master specifications and the City lead removal protocol and other applicable Federal, State and City regulations.

h) Polychlorinated Biphenyls

Suspect PCB-containing equipment would be surveyed and evaluated prior to building demolition or renovation. PCB-containing equipment that would be disturbed by the work would be removed and disposed of in accordance with applicable federal, State, and local regulations.

6. Handling, Storage, Transportation, and Disposal of Hazardous Materials

Wastes containing hazardous materials require special handling, storage, transportation, and disposal methods to prevent releases that could impact human health or the environment. The NYSDEC requires the implementation of fugitive dust control measures at sites that contain elevated concentrations of SVOCs and metals (TAGM 4031, Fugitive Dust Suppression and Particulate Monitoring Program). To confirm the effectiveness of the dust control measures, Community Air Monitoring Plans that are approved by the New York State Department of Health are implemented if applicable.

Depending on the nature of the material, federal, State, and local regulations require the use of special containers or construction of impoundments for on-site storage of the material to prevent the release of hazardous materials to the environment. The federal, State, and local Departments of Transportation (DOT) have requirements for transportation of wastes containing hazardous materials. The NYSDEC identifies hazardous waste and other waste management requirements in 6 NYCRR Parts 360 through 376. Facilities that receive hazardous materials require federal, State, and local permits to accept the waste. The waste facilities require representative waste sampling and laboratory analysis prior to accepting material for disposal.

Requirements for handling, storage, transportation, and disposal of hazardous materials will be included in the CEPP, as described in Section H below.

C. EXISTING CONDITIONS

According to historical maps and other available historical documentation (see Chapter 9, “Architectural Historic Resources” and Chapter 10, “Archaeological Resources” for additional information), much of the Project Area was originally comprised of river banks and adjacent wetland areas of the Hudson River prior to the industrial development in the early 19th century. During this period, significant railroad development occurred throughout much of the Project Area to facilitate the expanding shipping-, manufacturing-, and transportation-related development, including the area between what is now Eleventh and Twelfth Avenues.

Early development in and around the railroad yards, close to the port areas, was a mix of small industries, metalworks, lumberyards, sawmills, hay and freight depots, stockyards, meat processing and packing facilities, and gas tanks interspersed among row houses. The areas east of Tenth Avenue were more residential than the locations closer to the port areas along the Hudson River.

Several distinct actions changed the character of the Project Area in the early part of the 20th century. The first major action was the development of a passenger rail tunnel under the Hudson River by the Pennsylvania Railroad, to a new station located at West 33rd Street and Seventh Avenue. The second

Note: Potential Development Site 68 is considered in the Future Without the Proposed Action Condition.

The following are descriptions of the historical and/or current land uses identified on each of the potential and projected development sites and the type of contamination (either non-petroleum or petroleum related) that could be present on the site. Lots indicated with an asterisk (*) are not expected to be redeveloped under the Proposed Action, and therefore would not be mapped with an (E) Designation. These lots would transfer air rights to adjacent lots within the development site.

a) Projected Sites

Projected Development Site 1

Block 702 Lot 1 has historically been and is currently occupied by a rail yard. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 2

This site comprises Block 705 Lots 1, 5, 54, and 68, which are currently occupied by the Copacabana nightclub. Historically, this site was occupied by a machine shop. As a result, there is potential for non-petroleum contamination on the site.

Projected Development Site 3

This site comprises Block 705 Lots 29, 30, 32, 39, 41, 42, 45, 46, and 53, which are currently, and were historically, occupied by a publishing shop, Federal Express package distribution center and garage, and commercial offices; therefore there is potential for non-petroleum contamination on the site.

Projected Development Site 4

This site comprises Block 706 Lots 1, 10, and 55, which are currently occupied by Bell Atlantic vehicle/truck storage, a construction supply business, and a vacant building. Historically, this site

Projected Development Site 13

This site comprises Block 710 Lots 20, 22, 27, 29, and 42, which are currently occupied by a machine shop, an auto repair facility, and warehouse storage. Historically, this site contained petroleum storage (e.g., gasoline tanks), an auto repair and a machine shop. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 14

This site comprises Block 1069 Lots 24, 29, 34, and 136, which are currently occupied by a religious institution, vehicle parking, and an auto repair facility. Historically, this site contained petroleum storage (e.g., gasoline tanks) and an auto repair facility. Due to the presence of petroleum storage and an auto repair, there is potential for petroleum contamination on the site.

Projected Development Site 15

This site comprises Block 1070 Lot 1, which is currently occupied by a Federal Express distribution facility and garage, and was historically occupied by an electrical substation; therefore, there is potential for non-petroleum contamination on the site. [The adjacent Lot 5 is the Con Edison Substation on this block.]

Projected Development Site 16

This site comprises Block 1070 Lots 49, 50, and 54, which are currently occupied by vehicle parking. Historically, this site was occupied by an electrical substation. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 17

This site comprises Block 1090 Lots 9, 10, 11, and 109, which contain a currently vacant lot, and three tenement buildings with ground floor commercial/retail uses. Historically, this site was occupied by a railroad equipment manufacturer. As a result, there is potential for non-petroleum contamination on the site.

Projected Development Site 18

This site comprises Block 1090 Lots 20, 23, 29, 36, and 42, which currently contain petroleum storage (e.g., fuel oil tanks), Verizon truck storage and maintenance facilities, and a gas station. As a result, there is potential for petroleum contamination on the site.

Projected Development Site 19

This site comprises Block 1051 Lots 1, 49, 50, 51, 53, and 57, which are currently occupied by a commercial auto rental facility, theaters, and commercial offices. Historically, this site was occupied by the same auto rental facility. As a result, there is potential for petroleum contamination on the site.

Projected Development Site 20

This site comprises Block 1050 Lots 1, 6, 61, and 158, which are currently occupied by vehicle parking and community facilities. Historically, this site was occupied by a coal yard and a piano factory. As a result, there is potential for non-petroleum contamination on the site.

Projected Development Site 21

This site comprises Block 736 Lots 1 and 73, which are currently occupied by transportation uses (e.g., roadways). Historically, this site contained petroleum storage (e.g., gasoline tanks). As a result, there is potential for petroleum contamination on the site.

Projected Development Site 31

Block 729 Lot 1 is currently adjacent to (within 400 feet) Block 729, Lot 50. Due to the historical presence of the railroad right-of-way at Block 729, Lot 50, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 32

Block 729 Lot 60 is currently occupied by vehicle parking. Historically, this lot was occupied by the trucking terminal and railroad right-of-way. Due to the historical presence of the trucking terminal and railroad right-of-way, there is a potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 33

Block 729 Lot 50 is currently occupied by the railroad right-of-way. Historically, this lot was occupied by the railroad right-of-way. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 34

This site comprises Block 729 Lots 50, 60, and 163, currently occupied by the railroad right-of-way and a commercial loft building. Historically, this site was occupied by a railroad right-of-way. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 36

This site comprises Block 763 Lots 31*, 32, 34, 38, and 42, 43*, 44*, which are currently occupied by commercial, retail, and residential uses. Historically, this site was occupied by an electrical substation. As a result, there is potential for non-petroleum contamination on the site.

Projected Development Site 37

Block 762 Lot 6 is currently occupied by a commercial development; historically, this lot was occupied by a machinery repair shop. As a result, there is potential for petroleum contamination on the site.

Projected Development Site 38

Block 762 Lot 61 is currently adjacent to (within 400 feet) a site with potential contamination, Block 763 Lot 60, which is currently the site of an auto repair facility. As a result, there is potential for petroleum contamination on the site.

Projected Development Site 39

This site comprises Block 762 Lots 13, 14*, 16, 17*, and 60, which are currently occupied by retail, residential, and commercial uses. Historically, this site was occupied by a machinery repair and publishing shop. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Projected Development Site 40

Block 761 Lot 62 is currently adjacent to (within 400 feet) Block 761 Lot 10, which is currently a machinery repair facility. As a result, there is potential for petroleum contamination on the site.

Projected Development Site 41

This site comprises Block 761 Lots 10, 13, 20*, and 43, which are currently occupied by a paper product manufacturer, sewing machine manufacturer, and vehicle parking. Historically, this site was occupied by a machinery repair and textiles manufacturer. As a result, there is potential for petroleum and non-petroleum contamination on the site.

Potential Development Site 53

This site comprises Block 735 Lots 11, 12*, 13, 17, 55*, and 57*, 58*, 59*, 60, which are currently occupied by an auto repair facility, vehicle parking, vacant land, a vacant building, and residential. Historically, this site was occupied by auto repair. As a result, there is potential for petroleum contamination on the site.

Potential Development Site 54

This site comprises Block 734 Lots 6-8 and 62*, which are currently occupied by vehicle parking, residential, and commercial. Historically, this site was occupied by an auto repair shop and a wrecking facility. As a result, there is potential for petroleum contamination on the site.

Potential Development Site 55

This site comprises Block 734 Lots 9*, 10, and 13*, which are currently occupied by a warehouse and residential uses, and were historically occupied by an auto repair facility; therefore, there is potential for petroleum contamination on the site.

Potential Development Site 56

This site comprises Block 733 Lots 59*, 60, 61, 62, 63, 64, 65*, 66*, which are currently, and were historically, occupied by an auto repair facility, residential, commercial, and institutional/public facility; therefore, there is potential for petroleum contamination on the site.

Potential Development Site 57

This site comprises Block 733 Lots 8, 9, and 58, which are currently occupied by vehicle parking. Historically, this site contained an auto repair shop and petroleum storage (e.g., gasoline tanks). As a result, there is potential for petroleum contamination on the site.

Potential Development Site 58

This site comprises Block 733 Lots 23, 24, and 43*, 44*, 45*, 46*, 47, which are currently occupied by vehicle parking and residential uses. Historically, this site was occupied by a machine shop; therefore, there is potential for petroleum contamination on the site.

Potential Development Site 59

This site comprises Block 732 Lots 70 and 72*, which are currently occupied by an auto repair facility, furniture cleaning, and residential property. Historically, this site was occupied by a gas station; therefore, there is potential for petroleum contamination on the site.

Potential Development Site 60

Block 732 Lot 50 is currently vacant land. Historically, this lot was occupied by a machine shop; therefore, there is a potential for petroleum contamination on the site.

Potential Development Site 61

Block 731 Lot 22 is currently occupied by vehicle parking. Historically, this lot was also occupied by vehicle parking; therefore, there is potential for petroleum contamination on the site.

Potential Development Site 62

This site comprises Block 728 Lots 4, 67, and 69, which currently contain construction-related and residential uses. Previous use of the site included petroleum storage (e.g., fuel oil tanks); therefore, there is potential for petroleum contamination on the site.

photography processing facility; therefore, there is potential for petroleum and non-petroleum contamination on the site.

Potential Development Site 75

This site comprises Block 761 Lots 5, 7, and 9*, which are currently used for retail, commercial, residential, and vehicle parking uses. Historically, this site was the site of a machinery repair facility. Based on the current and historical site uses, there is potential for petroleum and non-petroleum contamination on the site.

Potential Development Site 76

Block 761 Lot 41 is adjacent to (within 400 feet) potential contamination; as a result, there is potential for petroleum and/or non-petroleum contamination on the site.

Potential Development Site 77

Block 761 Lot 28 is currently commercial office space and was historically used for medical purposes. As a result, there is potential for non-petroleum contamination on the site.

Potential Development Site 78

This site comprises Block 760 Lots 67 and 68, which currently contain vehicle parking and a construction contracting company. Historically, this site was a gasoline station; therefore, there is potential for petroleum contamination on the site.

Potential Development Site 79

Block 760 Lot 63 is adjacent to (within 400 feet) potential contamination, Block 760 Lot 16, which is currently a trucking terminal; therefore, there is potential for petroleum and/or non-petroleum contamination on the site.

Potential Development Site 80

This site comprises Block 760 Lots 58, 59, 60, 61*, 62*, which are currently used for commercial, residential, and vehicle parking purposes. Historically, this site was a piano factory; therefore, there is potential for non-petroleum contamination on the site.

Potential Development Site 81

Block 760 Lot 55 is adjacent to (within 400 feet) potential contamination, Block 760 Lot 51, which historically was a filling station; therefore, there is potential for petroleum and/or non-petroleum contamination on the site.

Potential Development Site 82

Block 760 Lot 51 is currently used for vehicle parking; historically, this site was occupied by a gasoline station and a piano factory. Based on the current and historic land uses, there is potential for petroleum and non-petroleum contamination on the site.

Potential Development Site 83

This site comprises Block 760 Lots 16, 51, and 68, Block 761 Lot 10, and Block 759 Lot 27, which were considered to be potentially contaminated as they are adjacent to (within 400 feet) potential contamination. As a result, there is potential for petroleum and/or non-petroleum contamination on the site.

TABLE 14-5 (CONTINUED)
SUMMARY OF MIDBLOCK PARK AND BOULEVARD SYSTEM &
UNDERGROUND PARKING GARAGE RECS

Block/ Lot #	Street Address	On-site RECs	Off-site RECs	Above-Grade Concerns
0709/023	521-523 W. 37th St.	None Identified	Unknown type of factory, trucking facility, auto repair/parking	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0709/025 & 046	513-519 W. 37th St. / 510-520 W. 38th St.	Trucking facility	Coal yard, trucking facility, auto garage and five active NY Spills/LTANKS	Structure located on-site, ACM, LBP, and/or PCB- containing equipment (parking attendant shed)
0709/052	522-524 W. 38th St.	Auto repair facility	None Identified	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0710/011	535 W. 38th St.	Coal yard and auto repair facility	Coal yard, truck and bus parking and five active NY Spills/LTANKS	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0710/015	520 W. 39th St.	Historical railroad right-of-way and auto repair facilities, NY SPILLS/LTANKS site	Auto repair facility	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0710/020	519 W. 38th St.	Coal yard, truck and auto repair facility	None Identified	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0710/022	509 W. 38th St.	Unavailable documentation regarding two fill ports apparently concreted over	Coal yard, scrap metal facility, trucking facility/garage, manufacturing facility and an auto repair facility	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
1070/020	515 W. 38th St.	Railroad right-of-way and 10,000-gallon heating oil UST on-site	None Identified	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
Properties Above the Parking Garage				
0706/010	539-545 W. 34th St.	Unknown type of factory, staining around fill port near the building	Garage, foundries, machine shops, charcoal storage facilities, iron warehouse, factories, garage with gasoline USTs, motor freight station, post office/Federal Express facility with gasoline and fuel oil tanks and maintenance garage	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0706/015	533-535 W. 34th St.	Unknown type of factory	Unknown type of factories, interior conduit and interior gas works, foundries, factories, machine shops, electric works, steam boiler works, furniture company with gasoline tanks, motor freight stations, post office/Federal Express facility with gasoline and fuel oil tanks	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0706/017	527-531 W. 34th St.	Unknown type of factory, interior conduit and interior gas works and furniture company with gasoline tanks	Brass foundries, boiler shops, iron shops, machine shops and garage with gasoline USTs	Structure located on-site, ACM, LBP, and/or PCB- containing equipment
0706/048	534-536 W. 35th St.	None Identified	Interior conduit and interior gas works, electrical works, unknown type of factories, motor freight station, furniture company with gasoline tanks	Structure located on-site, ACM, LBP, and/or PCB- containing equipment

3. No. 7 Subway Extension

The areas of each of the project elements associated with the No. 7 Subway Extension were evaluated for the potential presence of hazardous materials as described in Section B. The following section includes the results of this evaluation organized by the various components of the No. 7 Subway Extension.

Since most of the No. 7 Subway Extension would be constructed within consolidated bedrock located 70 feet or more below grade, the potential for adverse hazardous materials impacts is expected to be limited. The construction of the No. 7 Subway Extension would be accomplished by tunneling through bedrock with the use of a TBM, mining (e.g., drilling and blasting), and excavation (including cut-and-cover). See Chapter 23, "Construction Impacts" for additional information concerning construction methods. Potential exposure to hazardous materials increased in areas of subsurface penetration such as excavation activities associated with the TBM launch and retrieval sites (Site A and Site L), cut-and-cover construction methods, station locations, ancillary facilities, laydown areas and shaft ways. Site A, Site L, and the proposed station locations were evaluated separately from the overall alignment and are summarized separately below; the ancillary facility locations, laydown areas and shaftways (e.g., Sites J, M, N) were considered part of the general alignment.

a) Alignment

Geotechnical sampling and analysis activities along the proposed alignment have identified Serpentinite in the bedrock, which may contain deposits of naturally occurring asbestos (NOA). The Serpentinite deposits have been identified in an approximately 800-linear-foot section of the alignment from West 26th Street to West 29th Street along Eleventh Avenue at a less than 1 percent level. Although naturally occurring, asbestos can pose a potential health risk to workers when the serpentinite is pulverized by the TBM, generating airborne fibers.

In addition to the identification of serpentinite, the geotechnical alignment borings for the No. 7 Subway Extension identified petroleum-contaminated soil at six locations:

- Boring PE-30 (West 26th Street and Eleventh Avenue): Located on the sidewalk south of West 26th Street approximately 200 feet east of Eleventh Avenue. Thirty-six inches of black, stained, silty sand was encountered beneath the concrete sidewalk during hand augering. Petroleum odors were noted at the boring location.
- Boring PE-19 (West 35th Street and Eleventh Avenue): Located on the sidewalk south of West 35th Street approximately 50 feet east of Eleventh Avenue. Petroleum/chemical odors were detected from the soil collected at approximately 25 to 32 feet below grade.
- Boring GA-4 (West 28th Street and Eleventh Avenue): Located on the sidewalk north of West 28th Street approximately 50 feet east of Eleventh Avenue. Ten inches of black, stained, silty sand was encountered beneath the concrete sidewalk during hand augering from the depth of approximately three to four feet below grade.
- Boring PE-7 (West 41st Street and Tenth Avenue.): Located on the sidewalk south of West 41st Street approximately 50 feet west of Tenth Avenue. Six inches of black, stained, silty sand was encountered beneath the concrete sidewalk during drilling from the depth of approximately 10 to 12 feet below grade.

Boring SB2-4 (West 26th and Eleventh Avenue): Located on the sidewalk on the west side of Eleventh Avenue, approximately 20 feet north of 26th Street. Strong petroleum odor and staining were detected in the soil collected from 6 to 17 feet below grade.

Lack of closure documentation could indicate that the tank was not closed in accordance with NYSDEC regulations and, therefore, the condition of the subsurface in the area of the tank cannot be accurately assessed. Therefore, the area of the former UST is considered an REC.

Petroleum-contaminated soils were identified beneath the sidewalk on the northern border of the property during the advancement of geotechnical alignment boring PE-30. This is considered an open spill case by the NYSDEC. The presence of petroleum-contaminated soils beneath the sidewalk adjacent to the property is considered an REC.

As a result of these findings, a program of subsurface soil and groundwater sampling and laboratory analysis was performed. Five soil borings were advanced; five soil and one groundwater sample were collected and sent to a NYSDOH-certified laboratory for analysis. The soil samples were analyzed for VOCs, SVOCs, PCBs, metals, and RCRA Characteristics. The groundwater sample was analyzed for VOCs, SVOC, PCBs, metals, and DEP sewer discharge parameters.

The results of the investigation revealed that Site A is underlain by fill materials that contain elevated concentrations (exceeding the NYSDEC TAGM 4046RSCOs) of metals (beryllium, chromium, copper, mercury, nickel, selenium, and zinc). Elevated concentrations of two SVOCs (benzo(a)anthracene and chrysene) were also detected in one sample, but not in samples collected elsewhere at the site. These contaminants are commonly found in urban fill materials and likely do not reflect on-site releases from historic or current usage. Minimal concentrations of the VOCs acetone and methylene chloride were detected in the soil samples; however, the concentrations detected did not exceed TAGM RSCOs. PCBs, pesticides, herbicides, TCLP VOCs, and TCLP SVOCs were not detected in the soil samples. TCLP chromium was detected in one sample; however, its concentration did not exceed RCRA hazardous waste characteristics. TCLP chromium was the only TCLP metal detected. Soil samples did not exhibit characteristics of hazardous waste. The results of the sampling indicate that the petroleum-contaminated soils noted beneath the sidewalk, adjacent to the property, have not had a widespread, if any, impact on Site A, as petroleum-type contaminants were absent from soil and groundwater samples.

Results of the groundwater sampling revealed that one SVOC (Chrysene) was detected at a concentration that exceeds the NYSDEC Technical and Operational Guidance Series (TOGS) standard. Laboratory results also indicated that metals were present in the groundwater sample at concentrations that exceed the TAGM TOGS criteria. The concentrations of Chrysene and metals are expected to be the result of sediment in the sample and not groundwater conditions, as the sample was collected from a temporary well point, which caused sediment to be entrained in the sample. No VOCs or PCBs were present in concentrations that exceeded the NYSDEC TOGS criteria. Additionally, parameters regulated by DEP Limitations for Effluent to Sewers were not exceeded. Based on the results of the sampling, groundwater would not require pretreatment, except to remove sediment, prior to discharge.

Based on the Phase II ESA, there is minimal risk of exposure to contaminated soil for on-site receptors at Site A. The contamination identified no unique environmental concerns and requires no specific precautions beyond the typical measures employed during construction in New York City, and described within Section H, "Summary of Management Measures".

c) Site L – TBM Retrieval Site

Site L is located at 560 Tenth Avenue. As a result of the Phase I ESA of the Site, RECs were identified based on the review of historical maps (e.g., Sanborn Maps) and regulatory agency databases; the site inspection did not reveal any RECs.

The review of Sanborn Maps identified historical uses on the property and adjoining properties that are considered RECs; these include an ironworks, paint shop, coal yard and bus terminal. Off-site historical RECs include machine shop, paint and print shops, and a gas station.

material. Geotechnical soil borings advanced at Corona Yard indicate that the fill is underlain by four strata: organic clay; sand and gravel; varved silt and clay; and, glacial deposits, which overlie bedrock.

Corona Yard and neighboring sites, especially those to the west (upgradient), have been used for railroad and other industrial or heavy commercial purposes since the early 1900s (e.g., automotive repair and wreckage facilities, filling stations, and automobile scrap yards). Contaminants typically associated with such land uses include, but are not limited to, VOCs, SVOCs, and metals. Since the yard was constructed on fill material, it is likely to contain contaminants such as metals and SVOCs. Additionally, there are documented open NY Spills/LTANKS cases in the vicinity of the yard, which may have contaminated the subsurface soils and/or groundwater of the yard. The NYSDEC has issued an administrative notice to the Long Island Rail Road (LIRR) for contamination at the site which is alleged to be the result of petroleum spills. LIRR site investigations have confirmed the presence of "hot spots" of VOCs at the site. Additionally, the LIRR's testing has revealed that elevated concentrations of SVOCs are present in the fill material historically used to grade the site. Discussions between the NYSDEC and LIRR are ongoing to determine both the appropriate management for this site, and to address the likelihood that contamination found at this site is attributable to sources on neighboring sites.

Section H of this chapter includes preventative and management procedures that would be followed in order to minimize human contact with contaminants. In order to avoid adverse impacts to public health or to the environment, any such required action and/or management would be conducted in accordance with applicable law, and any regulatory requirements of the NYSDEC or DOL.

4. Convention Center Expansion Parcels

The Convention Center Expansion would require the acquisition of certain lots on Block 685 and all of Block 1088, both of which are located between Eleventh and Twelfth Avenues, between West 39th and 40th Streets and between West 40th and West 41st Streets, respectively. Block 1088 is the current location of the Quill Bus Depot, which would be relocated as a result of the Convention Center Expansion. Additionally, the expansion of the Convention Center would require the acquisition of the eastern portion of Block 1089 for the construction of a hotel. Block 1089 is bound by West 41st and 42nd Streets and Eleventh and Twelfth Avenues. The Convention Center Expansion also includes an area for expanded truck marshalling capabilities. The truck Marshalling Yard would be located directly south of the existing Convention Center, between 33rd and 34th Streets and Eleventh and Twelfth Avenues. The truck Marshalling Yard would be dedicated to servicing the trucks associated with operations at the expanded Convention Center. This yard would be connected to the Convention Center's loading docks via an unused, below-grade rail right-of-way extending from West 33rd to West 41st Streets between Tenth and Eleventh Avenues. The right-of-way is to be used as a truck marshalling route from the marshalling yard into the Convention Center's loading docks entry on 41st Street. Additionally, the Convention Center Expansion would encompass certain intervening streets, specifically West 39th, West 40th, and West 41st Streets, and parts of Eleventh Avenue.

a) Existing Convention Center

Through review of regulatory databases, government records, other documents and historical land use maps, the Phase I ESA indicated that from the late 1800s through the 1900s, the area currently used as the Convention Center (between 34th and 38th Streets and Eleventh and Twelfth Avenues) was occupied by railroad tracks and yards for rail companies such as New York Central & Hudson River Railroad Company; West Shore Lines; New York, Ontario & Western Railroad Company; and Pennsylvania Railroad Corporation. The Phase I ESA concluded that there is likely subsurface

VOCs or PCBs were detected in soil samples. SVOCs were detected in 17 soil samples, but none of the samples exceeded NYSDEC's TAGM RSCO for total SVOCs. Metals were detected in all the soil samples at levels above NYSDEC TAGM RSCOs. All water samples exceeded TOGS for metals and one sample exceeded TOGS for SVOCs. With the exception of very slight benzene exceedance at one monitoring well, no other exceedances were detected in any of the wells. Appendix O.2 presents laboratory results for soil and groundwater samples. The benzene contamination identified is likely attributable to the petroleum USTs that were formerly present on this parcel. This confirms the groundwater contamination identified in 1999 and reported in the Phase I ESA, but indicates that the extent of the contamination is limited. The other results are consistent with the presence of historic urban fill, which is typical for sites located in New York City. This type of fill is not uncommon and is not likely attributed to any of the areas of environmental concern identified in the Phase I ESA.

Based on the Phase II ESA, there is minimal risk of exposure to contaminated soil and groundwater for on-site receptors at Block 685. The contamination identified raises no unique environmental concerns and requires no specific precautions beyond the typical measures employed during construction in New York City, and described within at Section H, "Summary of Management Measures".

c) Existing Quill Bus Depot

The Convention Center Expansion would require the deconstruction and reconstruction of the existing Quill Bus Depot. The Phase I ESA review of Sanborn Maps indicated this site was formerly occupied by the Western Stock Yard Hog House, meat packing plant, a livestock holding yard, a leather tanning company, coal houses, and an iron yard until the 1950s. In 1968, the site was developed as a bus depot and fueling facility for the Greyhound Bus Company (Greyhound); in 1992 MTA NYCT acquired the property. The site continues to be used as a bus depot and fueling facility for bus repair, maintenance, and cleaning operations.

A review of regulatory databases and prior environmental reports concerning the site reveal that, in 1987, a diesel fuel release was discovered on the southwest portion of the property. The spill was apparently the result of a broken remote fill line. Beginning in 1989, several investigations were performed with regard to the various petroleum product storage systems located at the facility. Those reports document the discovery of separate-phase product, discovered beneath the Quill Bus Depot, that occurred as a result of the aforementioned diesel fuel release. The groundwater remedial effort set forth to address the diesel fuel release consisted of a pump-and-treat-type system that included the use of a vacuum truck to extract the product from the subsurface (Vault A) according to investigative reports. As of February 2004, approximately 424 gallons of petroleum product had been recovered from the property. This remedial effort is ongoing pursuant to the terms of a Consent Order between the NYSDEC and MTA NYCT regarding the management of this petroleum spill. The NYSDEC spill number assigned to the facility remains open.

The diesel fuel release occurred from a UST, which was part of a UST system installed along the west end of the property (along Twelfth Avenue near 41st Street). The system included a 5,000-gallon antifreeze tank, a 15,000-gallon motor oil tank, an 18,000-gallon diesel fuel tank, a 17,000-gallon diesel fuel tank and a 16,000-gallon diesel fuel tank. All tanks were contained within a concrete vault, which is known as "Vault A." In 1996 and early 1997, MTA NYCT rehabilitated the facility and replaced these diesel tanks with new systems. As a result of the aforementioned diesel fuel release, 53 soil borings were collected and six groundwater monitoring wells were installed at the site to determine the extent of contamination in the area of the UST system.

As noted, a number of subsurface investigations have been performed both in connection with the contamination in the vicinity of Vault A, and to investigate the condition of the site of other tank systems (i.e., Vaults B and D). In 1989, ten soil borings in the vicinity of Vault A were installed, two of which were converted to groundwater monitoring wells. In 1990, an investigation was conducted

d) Site of Relocated Quill Bus Depot

The Quill Bus Depot is proposed for relocation between West 30th and West 31st Streets and between Tenth and Twelfth Avenues; (the southern portion of Block 676 and 702).

The southern portion of Caemmerer Yard is part of the proposed location for the Quill Bus Depot. The eastern portion of this site, between Tenth and Eleventh Avenues, is the location of the former Metal Purchasing Co. Inc. Based on a review of historical documents, the building formerly housing the plant (presently vacant) was constructed sometime between 1930 and 1950. Operations in this building included sheet metal cutting and coating (varnishing).

As a result of the findings of the Phase I ESA, a work plan for a Phase II ESA was developed to collect samples of subsurface soil and groundwater. Specifically, thirty-one (31) soil borings were advanced in areas of potential environmental concern, and eleven (11) monitoring wells were installed. A number of these soil borings and monitoring wells were also utilized to characterize Caemmerer Yard, discussed below. One hundred and twenty-six (126) soil and eleven (11) groundwater samples were collected. No pesticides, herbicides or PCBs were detected in soil samples. SVOC and metals were detected in the soil samples at concentrations that exceed the TAGM RSCOs. Results of the statistical analysis reveal the mean concentrations of SVOCs benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and dibenzo(a,h)anthracene exceed TAGM RSCOs. The mean concentrations of copper, mercury, nickel, and zinc exceed the TAGM RSCOs and naturally-occurring background concentrations. With the exception of benzene in one soil sample, VOC concentrations did not exceed TAGM RSCOs levels. Groundwater samples did not contain VOCs, pesticides, herbicides or PCB concentrations above the TOGS values. Groundwater samples revealed concentrations of SVOCs and metals that exceeded the TOGS criteria; however, the types and levels detected are commonly the result of contaminants found in historic urban fill. Appendix O.2 presents laboratory results for soil and groundwater samples. This type of fill is not uncommon and is not likely attributed to any of the areas of environmental concern identified in the Phase I ESA.

Based on the Phase II ESA, there is minimal risk of exposure to contaminated soil and groundwater for on-site receptors in the area proposed for the relocated Quill Bus Depot. The contamination identified raises no unique environmental concerns and requires no specific precautions beyond the typical measures employed during construction in New York City, and described within Section H, "Summary of Management Measures".

e) Hotel Site

The proposed Convention Center Hotel site is located on the eastern half of Block 1089, on Eleventh Avenue between West 41st and 42nd Streets, which is currently a parking lot. Review of available Con Edison documents and Sanborn Maps indicated that this site was formerly occupied by the MGP operated by the Consolidated Gas Company (now Con Edison) from 1861 to the early 1920s. Based on the Sanborn maps, the MGP facility included coal storage areas, gas manufacturing and purification operations, and gas holders, which are large tanks with foundations that extend up to 20 feet below ground. The gas holders were located on the eastern portion of the parcel and the gas manufacturing and purification operations were located on the western portion of the property. The MGP extended to the former shoreline of the Hudson River. From the late 1920s until the early 1980s, the site was used as a freight depot for the Railway Express Agency, with a private garage. This site was also formerly occupied by a gasoline service station with five 550-gallon USTs, the Railway Express Agency, and parking for Greyhound Bus Lines. The site is currently used as a parking lot.

The types of contamination that are generally associated with former MGP facilities include VOCs, SVOCs (including PAHs), metals, and cyanide, while the types of contamination usually associated

advanced consistent with the work plan, and twenty-two (22) monitoring wells were installed. Two-hundred (200) soil samples and twenty-two (22) groundwater samples were collected. Field screening revealed that elevated concentrations of methane are not present in soil at Caemmerer Yard West. No pesticides, herbicides or PCBs were detected in soil samples. VOC concentrations exceeded TAGM RSCOs in three (3) soil samples; two of which were benzene exceedances. These exceedances appear to be isolated. Samples from thirty (30) soil borings revealed individual SVOC concentrations that exceeded TAGM RSCOs; however, none of the samples exceeded the NYSDEC's TAGM RSCC for total SVOCs. Statistical analysis revealed the mean concentrations of the SVOCs benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and dibenzo(a,h)anthracene exceed the TAGM RSCOs. Samples from thirty-two (32) soil borings revealed metals concentrations at levels above TAGM RSCOs. Statistical analysis revealed the mean concentrations of copper, mercury, nickel, and zinc exceed the TAGM RSCOs and naturally-occurring background concentrations. Appendix O.2 presents laboratory results for soil samples.

In two instances, potential petroleum impacts to soil were noted through field screening and the NYSDEC was notified (spill cases 04-07411 and 04-07107). Laboratory analyses confirmed the presence of petroleum contamination in one case (04-07411) and revealed no elevated concentrations of VOCs or SVOCs in the other (04-07107). Based on the analytical results, the NYSDEC was requested to close spill case 04-07107.

With the exception of isolated petroleum contamination (Case 04-07411, located on the sidewalk southeast of the intersection of Twelfth Avenue and West 33rd Street), the soil results are consistent with the presence of historic urban fill (confirmed through comparison of the fill material results to samples collected of native site soils), which was anticipated at the site. This type of fill is not uncommon and is not likely attributed to any of the areas of environmental concern identified in the Phase I ESA.

Groundwater sample results did not identify the presence of PCBs, pesticides or herbicides. Four groundwater samples revealed the presence of VOC concentrations above TOGS. Several of the groundwater samples exceeded TOGS for SVOC and/or metals concentrations; however, the types and levels identified are commonly the result of contaminants found where historic urban fill is present. Appendix O.2 presents laboratory results for groundwater samples.

The results of the Phase II ESA confirmed the hypothesis that anthropogenic activities (e.g., historic placement of fill material and use of hazardous materials (e.g., petroleum) had resulted in a random distribution of contamination at the site. The Phase II ESA revealed that the historic placement of fill material and the historic use of petroleum have resulted in conditions that require management.

Based on the Phase II ESA, there is minimal risk of exposure to contaminated soil and groundwater for on-site receptors at Caemmerer Yard West. The contamination identified raises no unique environmental concerns and requires no specific precautions beyond the typical measures employed during construction in New York City, and described within at Section H, "Summary of Management Measures".

e) Intrusive Investigation Results: Caemmerer Yard East

As a result of the findings of the Phase I ESA, a work plan for a Phase II ESA was developed to collect samples of subsurface soil and groundwater. Thirty-four (34) soil borings were advanced and four (4) monitoring wells were installed at Caemmerer Yard East to assess potential environmental concerns identified in the Phase I ESA. One hundred seven (107) soil samples and four groundwater samples were collected and sent to a NYSDOH-approved laboratory for analysis. Field screening revealed that elevated concentrations of methane are not present in soil at Caemmerer Yard East. No pesticides, herbicides or PCBs were detected in the soil samples and VOC concentrations did not exceed TAGM RSCOs. Soil samples revealed SVOC and metals concentrations that exceeded

TABLE 14-6
EXISTING CONDITIONS BLOCK 675

Block/ Lot #	Street Address	Onsite RECs	Offsite RECs	Above Grade Concerns
0675/001	260 West Side Highway	Soap factory, coal yard and truck parking area	Rail yards, coal yard, truck rental and terminal, and DSNY garage	Structure located on-site, ACM, LBP, and/or PCB-containing equipment
0675/012	613 W. 29th St.	Smelting and refining works, asbestos construction, trucking supply	Gasoline station with USTs and gasoline station	Structure located on-site, ACM, LBP, and/or PCB-containing equipment
0675/024	609 W. 29th St.	None Identified	Coal yard, railroad freight yard, NYSDOS maintenance facility, gasoline station with USTs and two active NY Spills	Structure located on-site, ACM, LBP, and/or PCB-containing equipment
0675/026 & 029	603 W. 29th St. & 301 Eleventh Ave.	Smelting and refining facility, asbestos construction company and express depot	Coal yard, rail yard, gasoline station with USTs and garage/gasoline station	Structure located on-site, ACM, LBP, and/or PCB-containing equipment
0675/036	309 Eleventh Ave.	Gasoline station with USTs and filling station	Iron works, railroad on Eleventh Avenue, express depot, and gasoline station	Structure located on-site, ACM, LBP, and/or PCB-containing equipment (gas station shop)
0675/038 & 039	604 & 606 W. 30th St.	Soap factory, coal yard, smelting and refining facility, DSNY garage and NY Times truck parking	Smelting and refining works, gasoline station with USTs, and a trucking facility	Structure located on-site, ACM, LBP, and/or PCB-containing equipment

Prior to construction, appropriate site investigations will be conducted to more fully characterize possible contamination in the area and to identify any further action, investigation, or management that would be required if the Proposed Action were to proceed. Section H of this chapter includes preventative and management procedures that would be followed in order to minimize human contact with contaminants. In order to avoid adverse impacts to public health or to the environment, any such required action, investigation or management would be conducted in accordance with applicable law, and any additional regulatory requirements of the NYSDEC, DOL or DEP, as appropriate.

D. 2010 FUTURE WITHOUT THE PROPOSED ACTION

Without the Proposed Action, the Project Area would generally continue in its current condition; however, moderate levels of residential and commercial redevelopment are expected to occur, as described in Chapter 3, "Analytical Framework."

Some of the Projected and Potential Development Sites would be redeveloped, resulting in ground disturbance comparable to ground disturbance with the Proposed Action.

Discussions between the NYSDEC and MTA LIRR are ongoing to determine both the appropriate actions for the northeast area of Corona Yard and the potential that contamination found at this site could be attributable to sources on neighboring sites. The extent and type of management to be performed will be determined as a result of these discussions.

Ongoing management of the documented releases at the Quill Bus Depot would continue until requirements of the existing Consent Order with the NYSDEC are met. Similar is expected for the site of the proposed Convention Center Hotel.

With the exception of the aforementioned sites, there would be no change to existing conditions at the properties associated with the elements of the Proposed Action. If the Proposed Action were not implemented, potentially hazardous materials would remain in place. Hazardous materials would be

TABLE 14-7

³ In the event that ULURP No. 040249 ZMM (CEQR No. 04DCP014M) is adopted before the Proposed Action, the (E) Designation on Block 1090, Lots 36 and 42, would be removed administratively by the Department of City Planning. The property owner would be bound to the terms of a DEP-approved Restrictive Declaration which would require the owner to characterize any hazardous materials contamination that may exist in subsurface soils and groundwater prior to any site disturbance.

prior to implementation. It will be reviewed to ensure that an adequate number of samples will be collected and that appropriate parameters are selected for laboratory analysis.

No sampling program may begin until written approval of a work plan and sampling protocol is received from the DEP. The number and location of sample sites should be selected to adequately characterize the type and extent of the contamination, and the condition of the remainder of the site. The characterization should be sufficiently complete to determine the necessary management strategy (if any) after review of the sampling data.

Task 2: A written report with findings and a summary of the data must be presented to the DEP after completion of the testing phase and laboratory analysis for review and approval. After receiving such test results, a determination will be provided by the DEP if the results indicate that management is necessary. If the DEP determines that no management is necessary, written notice shall be given by the DEP.

If management is necessary according to test results, a proposed management plan must be submitted to the DEP for review and approval. The fee owner(s) of the lot(s) restricted by this (E) Designation must perform such management as determined necessary by the DEP. After completing the management, the fee owner(s) of the lot restricted by this (E) Designation should provide proof that the work has been satisfactorily completed.

A DEP-approved construction-related HASP would be implemented during excavation and construction activities to protect workers and the community from potentially significant adverse impacts associated with contaminated soil and/or groundwater. This Plan would be submitted to the DEP for review and approval prior to implementation. With the implementation of the (E) Designation, no significant adverse impacts related to hazardous materials would occur.

2. No. 7 Subway Extension

The contaminants that could potentially be encountered within the Project Area during the construction and/or excavation of the elements associated with the No. 7 Subway Extension include VOCs, SVOCs, PCBs and metals in both the soil and groundwater; additionally, NOA in bedrock could be encountered between 26th and 29th Streets. Contaminants that could be encountered as a result of the demolition of buildings include ACM, LBP, and PCB-containing equipment. The elements of the No. 7 Subway Extension include:

- Alignment (including lay down areas and shaft-ways);
- Site A and Site L; and
- Station Locations (including ancillary facilities).

Section H of this chapter includes preventative and management procedures that would be followed in order to minimize human contact with contaminants and eliminate the potential for significant adverse environmental impacts. Any such required action, investigation, or management would be conducted in accordance with those procedures as well as applicable law, and any additional regulatory requirements of the NYSDEC, DOL or DEP, as appropriate.

3. Corona Yard

The contaminants that could potentially be encountered during the construction and/or excavation of Corona Yard include VOCs, SVOCs, and metals in both soil and groundwater. Discussions between the NYSDEC and LIRR are ongoing to determine the appropriate management for the northeast portion of this site. The resolution of these discussions will result in a remedial action plan.

Underlying Queens County is an EPA-designated sole source aquifer that supplies drinking water for southeastern Queens and Long Island, as discussed in Chapter 13, "Natural Resources." The

7. Multi-Use Facility at Caemmerer Yard

The contaminants that could potentially be encountered during the construction and/or excavation on Caemmerer Yard (the area bound to the north by West 33rd Street, to the south by West 30th Street, to the east by Tenth Avenue, and to the west by Twelfth Avenue) include VOC, SVOCs, and metals, in both soil and groundwater, if the construction requires subsurface intrusion(s) that could impact groundwater, which could be required for footings of the deck proposed for the western part of the Yard. All petroleum-contaminated soil and groundwater would be managed as per the procedures set forth in Section H of this chapter, which include preventative and management procedures to be followed in order to minimize human contact with contaminants and eliminate the potential for significant adverse environmental impacts. Section H of this chapter includes preventative and management procedures that would be followed in order to minimize human contact with contaminants and eliminate the potential for significant adverse environmental impacts. Any such required action, investigation, or management would be conducted in accordance with applicable law, and any regulatory requirements of the NYSDEC, as appropriate.

8. Underground Public Parking Garage (under the Midblock Park and Boulevard System)

The contaminants that could potentially be encountered during the construction and/or excavation of the underground parking facility include VOCs, SVOCs, PCBs, and metals in both the soil and groundwater; should buildings be deconstructed as part of this action, ACM, LBP, and PCB-containing equipment are additional contaminants that could be encountered. Section H of this chapter includes preventative and management procedures that would be followed in order to minimize human contact with contaminants and eliminate the potential for significant adverse environmental impacts. Any such required action, investigation, or management would be conducted in accordance with applicable law, and any regulatory requirements of the NYSDEC, DOL or DEP, as appropriate.

9. Construction of southern portion of the Midblock Park and Boulevard System (Block 705 Lot 53 and 54)

Construction of the Midblock Park and Boulevard System is expected to begin in mid-2006 and progress north sequentially, with completion assumed before 2025. However, for the first construction analysis year, 2006/2007, only one block is projected to be under construction – the central portion of Block 705, bounded by West 33rd and West 34th Streets and Tenth and Eleventh Avenues. The major construction activities would include grading and the placement of a sand/gravel base; during such activities, the contaminants that could potentially be encountered include VOCs, SVOCs, PCBs, and metals in the soil. Groundwater is not expected to be affected. During the demolition of the existing three-story masonry structure ACM, LBP, and PCB-containing equipment could also be encountered. Section H of this chapter includes preventative and management procedures that would be followed in order to minimize human contact with contaminants and eliminate the potential for significant adverse environmental impacts. Any such required action, investigation, or management would be conducted in accordance with applicable law, and any regulatory requirements of the NYSDEC, DOL or DEP, as appropriate.

10. Relocation and Consolidation of NYPD Tow Pound, DSNY Facility and its Associated Parking Facility (or demolition of buildings to develop an at-grade park)

The contaminants that could potentially be encountered during the construction and/or excavation for the relocation and consolidation of the NYPD Tow Pound and DSNY include VOCs, SVOCs, PCBs, and metals in both the soil and groundwater; should buildings be deconstructed as part of this action, ACM, LBP, and PCB-containing equipment are additional contaminants that could be encountered. Section H of this chapter includes preventative and management procedures that would be followed

to West 42nd Street as indicated on Table 14-7. The major construction activities associated with the development of the aforementioned area would include demolition of buildings and the grading and placement of a sand/gravel base. Contaminants that could potentially be encountered include VOCs, SVOCs, PCBs, and metals in soil; groundwater is not expected to be affected but if it were to be, the same contaminants would be potentially encountered. During the demolition of buildings in this area, ACM, LBP, and PCB-containing equipment are likely to be encountered.

By 2025, the Midblock Park and Boulevard System on the block south of West 38th Street between Tenth and Eleventh Avenues would be constructed, requiring construction over the Empire Line. Construction methods for this segment differ from the initial segment (as discussed in 2010 Future With Proposed Action). The segment of the Midblock Park and Boulevard System constructed between 2010 and 2025 would be built partially over the rail cut, and a steel and concrete deck would be supported by driven piles.

This type of construction could result in encountering localized areas of contamination. The contaminants that could potentially be encountered include VOCs, SVOCs, PCBs, and metals in the soil and groundwater.

During the demolition of existing buildings contaminants that could potentially be encountered include ACM, LBP, and PCB-containing equipment.

3. Operations

All elements of the Proposed Action would be operational in this scenario. Since hazardous materials associated with each of the project elements would be managed, isolated, or removed during the construction phase, no significant impacts would occur during the operational phase of the Proposed Action.

H. SUMMARY OF MANAGEMENT MEASURES

Management measures have been developed to address potential hazardous materials that could be encountered through implementation of the Proposed Action. The management measures include implementation of a CEPP to manage hazardous materials during development of sites by the public Project Sponsors. Management measures for private development sites will be developed through the (E) Designation under the zoning amendments. The CEPP would consist of the development and implementation of specific measures to protect worker and public health and safety, as well as programs to manage contaminated materials during construction and thereby prevent any significant adverse impacts during construction from such materials. Implementation of these measures would also ensure that any hazardous materials that remain in place would be isolated to the extent required to prevent any significant adverse environmental impacts during the operational phase of the Proposed Action.

1. Further Investigations

Additional investigations, described below, would be undertaken, as appropriate, at properties to be acquired or developed privately to determine the nature and extent of contamination at the site of concern, and could include further regulatory agency document research, as well as soil and/or groundwater sample collection. Once the areas requiring excavation are better defined, and if physical testing is deemed necessary, a sampling protocol would be prepared. This protocol would indicate locations based on both the site's potential to have caused contamination and on the site's location relative to proposed construction activities for the Proposed Action. The following summarizes elements that the protocol used to conduct subsurface investigations would include:

- Illustrations that show the site location, the planned boring and monitoring well locations, and the field activities schedule

their respective project elements. The CEPP would include provisions for the following plans, described in detail below:

- Health and Safety Plan
- Soil Management Plan
- Spoils Management Plan
- Soil Gas Management Plan
- Groundwater Management Plan
- Petroleum Storage Tanks Management Plan
- Asbestos-Containing Building Materials Management Plan
- Lead-Based Paint Management Plan
- PCB-Containing Equipment Management Plan

a) Health and Safety Plan

HASPs would include measures to manage exposure to contaminated materials during construction associated with the Proposed Action. Each site specific HASP would include provisions for the handling of documented contaminated materials, as well as contingency measures to be taken if unanticipated contamination is encountered. For many of the activities associated with the Proposed Action, the OSHA provides regulations and guidelines that would be included in the HASP.

Implementation of the HASPs would be the principal means of protecting the workers and general public from exposure to contaminated materials. Contingencies to address potential hazards would also be included. Workers that have the potential to come in contact with contaminated materials would be required to read, understand, and implement the procedures specified in the HASPs. These procedures include health and safety guidelines and work practices to prevent exposure. The procedures would be developed through evaluation of the suspect contaminants and the work to be performed. Sampling and monitoring for the presence of contaminants would be included in the HASPs and implemented during the Proposed Action in accordance with OSHA regulations and guidelines. Monitoring of suspect contaminated materials would be performed through the analyses of air, soil, and rock to identify the presence of contamination and the need for additional testing.

As a requirement of the HASPs, personnel that have the potential to come into contact with contaminated materials would have specific training to assist them in identifying the presence of potential health and safety hazards. The HASP would include medical monitoring, certification, and training requirements for workers with the potential to encounter certain contaminated materials (e.g., lead, asbestos, hazardous waste, etc.).

b) Soil Management Plan

In general, the soil management plan would present the type of soil handling and disposal that would be utilized during construction activities. For contaminated soils that would remain in place, health and safety would be achieved through isolation. For contaminated soil that is excavated from the Project Area, off-site disposal would occur.

Isolation involves the construction of a barrier that prevents direct contact with, or migration of, contaminated soil. The use of impermeable barriers such as concrete and asphalt would also prevent percolation of surface water through subsurface soil, thus limiting the potential for contaminants to leach from soil to groundwater. Concrete and asphalt coverage serves as an effective isolation barrier. In-place isolation is a useful method of addressing contaminants such as metals, SVOCs, and PCBs, which are generally immobile. A layer of clean soil fill could be used to construct an isolation barrier in landscaped areas that would not be covered by impervious materials.

of waste being transported, and the truck routes that would be used to transport the waste. The vehicles and containers are designed to prevent the release of the waste material while it is being transported (i.e., trucks beds are enclosed with a tight fitting cover, roll-offs are sealed, etc.).

d) Soil Gas Management Plan

During construction activities, air monitoring, performed in accordance with the HASPs requirements, would be performed to assess the presence of contaminated soil gas. If present, contaminated soil gas (e.g., methane, hydrogen sulfide, VOCs) would be managed in accordance with the HASPs and Soil and Spoils Management Plans to prevent exposure to construction workers and the general public. Management options would include engineering controls and upgrading personal protective equipment used by the construction workers, which would be used separately or in combination, depending on the conditions encountered. Engineering controls would consist of ventilating the work area with exhaust fans. The use of vapor barriers and soil gas venting could also be used to treat contaminated soil gas in areas that would not be excavated. The ventilation exhaust would be treated on-site using contaminant-appropriate equipment (e.g., granulated activated carbon for VOCs) prior to discharging to the atmosphere. The HASPs would include contaminant-specific action levels that would identify conditions that require construction workers to upgrade their respiratory protection equipment. Real time contaminants-specific air monitoring would be performed in conjunction with respiratory protection upgrades to prevent exposure to the general public. As required, permits would be secured for any air treatment facilities.

e) Groundwater Management Plan

The groundwater management plan would provide a description of the methods used to collect, store, and dispose of contaminated water generated during dewatering activities. Additionally, the groundwater management plan would identify the permits required from the DEP and/or the NYSDEC to discharge the water into either the City's sewers or surface waters, respectively. Prior to obtaining DEP or NYSDEC discharge permits, groundwater would be sampled and analyzed to characterize its physical and chemical properties. Depending on the results of the analyses, the type of treatment prior to discharge, if required, would be determined. The type of treatment selected would be determined by the contaminants present in the groundwater. Both NYSDEC and DEP permits require that contaminated sediments (e.g., metals, PAHs PCBs) suspended in groundwater be removed prior to discharge. This would be achieved through the use of settling tanks and the injection of flocculants, causing suspended sediments to settle out of the water. The sediments would be analyzed to determine whether contaminants are present and, depending on the type and concentrations of contaminants, the disposal option that would be selected, as described in the soil management section.

If the groundwater contains VOCs, additional treatment would be performed on-site after the settling process and prior to discharge. The treatment could include agitation or the use of carbon filtration. Agitation extracts VOCs from the water by inducing them to partition into air, and is generally accomplished by forcing air through the water column in the other direction. Once the air passes through the water column, it is collected and filtered with carbon. The VOCs then adsorb to the carbon; and when the filters are spent, they are disposed of in a permitted facility. If this method is utilized, an air discharge permit would be obtained and discharges performed in accordance with the permit requirements (see Chapter 21, "Air Quality"). Alternatively, VOC- or PCB-contaminated groundwater could be filtered through carbon for treatment. This treatment utilizes a sealed container containing carbon, and VOCs and PCBs are removed as the water passes through the carbon.

Prior to implementing any treatment system or discharge of groundwater, samples would be collected and analyzed, a treatment system would be designed, and the information would be included in the NYSDEC or DEP permit applications. Approval from the responsible regulatory agency, in the form of a permit, would be obtained prior to construction activities. Depending on the quantity of water to

PB TEAM PHASE I EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

At the request of the City of New York (the City), the Parsons Brinckerhoff (PB) Team conducted a Phase I Environmental Site Assessment (ESA) of the property located at 537-547 Tenth Avenue, New York, New York (Block 1069 Lots 29 and 34, hereafter referred to as the "Subject Property"). The purpose of this ESA is to identify, to the extent feasible, the presence or likely presence of hazardous substances or petroleum products on or near the Subject Property.

These hazardous substances and petroleum products are defined in the American Society of Testing and Materials (ASTM) Standard Practice E 1527-00 as *recognized environmental conditions (RECs)*. In addition, other environmental issues and conditions not considered to be *RECs* are identified in this assessment. These include *historical RECs* or *de minimis* conditions.

The Phase I ESA also includes a preliminary evaluation of specific potential environmental issues or conditions that are, according to ASTM E 1527-00, considered non-scope considerations. These issues include radon, asbestos-containing materials, lead-based paint, and polychlorinated biphenyls. The Phase I ESA includes a review of regulatory agency databases and historical maps, and visual observations of the Subject Property and adjoining properties.

The City has requested that this assessment be conducted for purposes of environmental due diligence in order to qualify for the innocent landowner defense to CERCLA liability. In addition, the assessment is intended to identify conditions that have the potential to impact the use of the Subject Property as part of the No. 7 Subway Extension in conjunction with the Hudson Yards Rezoning and Development Program.

The Subject Property consists of an approximately 17,875-square foot rectangular-shaped parcel located on the west side of Tenth Avenue, between West 40th and West 41st Streets, in an area that is primarily characterized by commercial uses. Review of historical Sanborn Fire Insurance Maps identified RECs associated with historical uses of the Subject Property and adjoining properties. These historical RECs include a "Chinese Laundry", a gas station and an automobile repair garage at the Subject Property, and a coal yard, a piano factory and several gas stations at adjoining properties.

Review of regulatory agency databases identified the Subject Property, as well as two nearby facilities, as active New York Spills/Leaking Underground Storage Tanks (NY Spills/LTANKS) cases that are considered RECs.

Based on the findings of this Phase I ESA, the identified RECs would not preclude use of the Subject Property as part of the Hudson Yards Rezoning and Development Program in conjunction with the proposed extension of the No. 7 Subway Extension; however, prior to acquisition or development, it is recommended that a program of subsurface sampling and laboratory analysis be performed to determine if releases associated with the historical land uses and three open NY Spills/LTANKS cases have impacted soil and/or groundwater at the Subject Property, specifically in areas where construction activities are proposed.

EXECUTIVE SUMMARY

The Parsons Brinckerhoff (PB) Team was retained by New York City Transit (NYCT) to perform a Phase I Environmental Site Assessments (ESA), for the properties located at 537 – 547 Tenth Avenue (hereafter referred to as "Site M"), New York, New York (Block 1069, Lots 29 and 34) for the No. 7 Subway Extension.

Site M is bound on the north by West 41st Street, on the south by West 40th Street, to the west by St. Raphael's Catholic Church, and on the east by Tenth Avenue. Site M is comprised of a 1-story CC Truck Rental Office and a paved, ground level parking lot.

During construction, Site M may be utilized as a temporary access for spoil removal for the Tenth Avenue Station cavern and various staging activities. The northern section of Site M would be excavated approximately 75 feet below grade for a new systems building to support the proposed Tenth Avenue Station of the No. 7 Subway Extension. These construction activities would occur primarily below grade through mining (drill and blasting) and excavation (cut-and-cover). The No. 7 Subway Extension running tunnel under West 41st Street, just north of Site M, would be mined by a Tunnel Boring Machine (TBM). The proposed development would require some degree of existing soil and bedrock excavation/removal, soil reuse and disposal, and dewatering to allow for construction. Potential exposure to hazardous materials is increased in areas of subsurface penetration such as during construction activities on Site M.

The purpose of the Phase II ESI was to determine if the environmental conditions identified in the Phase I Environmental Site Assessment (ESA), prepared by the PB Team in June 2004 (PB, 2004) for MTA/NYCT, have resulted in soil and/or groundwater impacts at the Site, and as such, would require management measures. The results of the Phase II ESI were then used to characterize chemical and physical characteristics of the soil and groundwater at the Site. The characterization was used to evaluate potential risks to workers and the general public, and it provides guidance to determine the required procedures for managing soil and/or groundwater encountered during construction.

The field investigation was performed from December 21st to December 22nd, 2005 and included the advancement of ten (10) soil borings and collection of three (3) groundwater samples. All borings were advanced to a refusal, which was encountered at approximate depths of 15 to 30 feet below the ground surface. At locations where shallow refusals were encountered, repeated attempts were made to reach the anticipated depth of the bedrock. The depth of deep refusals during this investigation was consistent with the anticipated depth of the bedrock (with the exception of GP-5 - see below). One common characteristic of all sampling locations at this site was a very significant thickness of structural fill composed primarily of construction debris (up to 16 feet). At location GP-5, at the center of the northern section of the site, the entire sampling column from the grade to 16' below grade (BG) was composed of construction debris, with a refusal at 16' BG likely due to the debris.

Samples from all soil borings were submitted for analysis for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) identified in the New York State Department of Environmental Conservation (NYSDEC) Spill Technology and Remediation Series Memo #1 (STARS), Target Analyte List (TAL) Metals, pesticides and polychlorinated biphenyls (PCBs), PLM Asbestos and Resource Conservation and the Recovery Act (RCRA) Waste Characteristics reactivity, corrosivity, and flashpoint.

The laboratory results indicate that the soils at the Site contain elevated concentrations of SVOCs, pesticides and metals. The compounds detected are commonly present in fill materials located throughout New York City. The absence of high concentrations of target contaminants in the groundwater samples indicates the likelihood of relatively small-quantity localized releases of SVOC on-site, as well as the presence of high levels of metals in the structural fill used to raise the surface elevation of the site. The NYSDEC may not permit reuse of soil excavated from the site due to the elevated concentrations of SVOCs and metals. Based on the results of the laboratory analysis, the subsurface material excavated during construction would likely be classified as non-hazardous waste if it is determined that off-site disposal is required.

Prior to construction, the Contractor is required to prepare an Environmental Assessment Report (EAR), which shall include pre-construction characterization of all materials to be generated during construction.

The proposed excavation will extend into the bedrock, to depths in excess of the maximum depth achieved during the Phase II assessment. A possibility exists for contaminants to be present in the fractured bedrock below the Site M; however, based on results of this study the possibility of this is very low. The Contractor will be required to prepare a Site-Specific Health and Safety Plan and Site-Specific Soil Management Plan to address the handling and management of soil excavated from the Site during the construction activities. Due to the extent of excavation and proposed construction activities at the Site, off-site disposal of soil is expected. The laboratory results indicate that soil would likely be classified as non-hazardous waste.

The groundwater samples were analyzed for VOCs, SVOCs, TAL Metals, and PCBs. Additionally, one groundwater sample was analyzed for New York City Department of Environmental Protection (NYCDEP) Limitations for Effluent to Sanitary or Combined sewers.

The results of the laboratory analyses of groundwater revealed that in the northern section of the Site, slight VOC and metal contamination is present in the groundwater. However, none of the parameters (with the exception of Zinc and Total Suspended Solids (TSS)) exceed the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS) No. 1.1.1 criteria or the NYCDEP Limitations for Effluent to Sanitary or Combined sewers. The elevated concentrations of Zinc, as well as elevated TSS values can be removed by the use of a sedimentation tanks prior to discharge into the sewer.

1.0 INTRODUCTION

The Parsons Brinckerhoff (PB) Team was retained by New York City Transit (NYCT) to perform a Phase I Environmental Site Assessments (ESA), for the properties located at 537 – 547 Tenth Avenue (hereafter referred to as "Site M"), New York, New York (Block 1069, Lots 29 and 34) for the No. 7 Subway Extension.

During construction, Site M may be utilized as a temporary access for spoil removal for the Tenth Avenue Station cavern and various staging activities. The northern section of Site M would be excavated approximately 75 feet below grade for a new systems building to support the proposed Tenth Avenue Station of the No. 7 Subway Extension. These construction activities would occur primarily below grade through mining (drill and blasting) and excavation (cut-and-cover). The No. 7 Subway Extension running tunnel under West 41st Street, just north of Site M, would be mined by a Tunnel Boring Machine (TBM). The proposed development would require some degree of existing soil and bedrock excavation/removal, soil reuse and disposal, and dewatering to allow for construction. Potential exposure to hazardous materials is increased in areas of subsurface penetration such as during construction activities on Site M.

The purpose of the Phase II ESI was to determine if the environmental conditions identified in the Phase I Environmental Site Assessment (ESA), prepared by the PB Team in June 2004 (PB, 2004) for MTA/NYCT, have resulted in soil and/or groundwater impacts at the Site, and as such, would require management measures. The results of the Phase II ESI were then used to characterize chemical and physical characteristics of the soil and groundwater at the Site. The characterization was used to evaluate potential risks to workers and the general public, and it provides guidance to determine the required procedures for managing soil and/or groundwater encountered during construction.

The Phase I ESA identified Recognized Environmental Conditions (RECs) associated with Site M. These RECs are listed below.

- *Historical Use of Property.* Site M (Lots 29 and 34, CC Truck Rental Office and Parking Lot) is located between West 41st Street and West 40th Street along Tenth Avenue, in an area primarily characterized by industrial, transportation, manufacturing, commercial, and limited residential uses. Based on a review of Sanborn Fire Insurance Maps, historical uses of the Subject Property considered RECs include: a "Chinese Laundry", a gas station and an automobile repair garage at the Subject Property, and
- *Historic Fill.* Site M was constructed on land that was filled-in during the later part of the 18th Century. The material used to create the land is of an unknown source and may contain elevated concentrations of Semi-Volatile Organic Compounds and/or metals.
- *Historical Use of Surrounding Properties.* At adjoining properties the REC's included: a coal yard, a piano factory and several gas stations, which may have resulted in release of petroleum, and possibly metals, to subsurface soil and groundwater, which could affect conditions at the property.
- *Petroleum Release On-Site and Surrounding Properties.* The New York Spills/Leaking Underground Storage Tanks (NY Spills/LTANKS) database, identified the Subject Property and a total of 54 NY Spills/LTANKS incidents within a one-half mile radius of the Subject Property. Of these, 33 were closed cases and 16 were cross- or downgradient of the Subject Property and are not considered RECs. Of the remaining

five open cases, one is the Subject Property and four are either upgradient or in close proximity (adjacent) to the Subject Property. Based on the distances, assumed hydraulic gradients, and current regulatory status, three cases are considered RECs because they have the potential to have impacted soil and/or groundwater at the Site M. The remaining two facilities listed are not considered RECs. Although upgradient of the Site M, these cases do not involve releases that have the potential to impact the Site M based on their distances and/or the significance of the reported spill. Contaminated soil discovered during tank removal at an old gas station on 6/29/95.

A site visit was conducted in September 2003 and November 2005. Site M is currently used as a commercial truck and van rental facility, and is an approximately 17,875-square foot lot paved with asphalt. Site M is bound on all sides by a chain-link fence. A church is located adjacent to the Site M to the west and a staging area for construction equipment is located to the south, across West 40th Street. The northern half of the Site M is occupied by a single-story concrete block structure with two bay doors. The building is similar in design to a gas station building, which is consistent with the Sanborn map review, which notes the presence of a gas station on the site from at least 1950 to 1996. The building is utilized as the offices of Courier Car Rentals, Inc. According to an employee, the building is heated by electric baseboards and no vehicle fueling is performed onsite. The former garage area of the building is utilized for storage. No automobile lifts were observed in this area. South of the building, the area is paved and occupied by a billboard. In the vicinity of the billboard and slightly to the north, the remains of a building foundation are visible protruding from the asphalt. This observation is consistent with the Sanborn map review, which notes the presence of an automobile repair garage until approximately 1996. The southern half of Site M is paved and used for vehicle parking. No evidence of fill and vent pipes associated with USTs was observed on the Site M or surrounding sidewalks. Minor pavement staining, typical of parking lots, was observed in various locations. This staining is considered a *de minimus* condition. No other evidence of contamination was observed, and no RECs were identified during the site inspection.

Because the Phase I ESA indicated potential sources of contamination (e.g., historical fill, historic site usage, underground storage tanks, nearby off-site sources), it is necessary to characterize the potential for subsurface materials to contain hazardous materials. As such, further investigations of the soil and groundwater quality of Site M are necessary and can be determined through a Phase II Environmental Site Investigation (ESI) of the property.

The objective of the Phase II ESI is to determine if the RECs identified in the Phase I ESA have resulted in soil and/or groundwater contamination beneath the Site that would require management measures. The results of the Phase II ESA are then used to characterize soil and groundwater at the Site and evaluate the potential risks to workers and the general public, as well as provides guidance on determining the procedures for managing soil and groundwater encountered during construction.

Phase II ESI consisted of the advancement of ten (10) soil borings (GP1-GP10) and collection of three (3) groundwater samples for laboratory analyses. Soil samples were collected for laboratory analysis from each of the borings as described in Section 4.1. Groundwater samples were collected from two temporary groundwater monitoring points and from one existing monitoring well.

This report provides a summary of the Site and surrounding area, the findings of the ESA, a discussion of the ESA activities performed, a presentation of the ESA findings and conclusions and recommendations.

2.0 BACKGROUND

As part of the Phase I ESA (PB, 2004) historical records (e.g., site land uses) and regulatory agency databases were reviewed; as a result of this review, RECs were identified both on- and off-site. On-site RECS include a "Chinese Laundry", a gas station and an automobile repair garage. At adjoining properties the REC's included a coal yard, a piano factory and several gas stations, which may have resulted in release of petroleum, and possibly metals, to subsurface soil and groundwater, which could affect conditions at the property. Also according to the Phase I ESA, three spill cases are considered RECs because of the proximity and assumed hydraulic gradients have the potential to have impacted soil and/or groundwater at the Site M.

The site reconnaissance portion of the Phase I ESA identified the presence of possible asbestos-containing materials (ACM) used in the construction of the 1-story building on-site, as well as, former USTs. A gas station operated on the site from at least 1950 to 1996. No details on the date of installation or tightness testing were available for storage tanks. An asbestos inspection and material survey was subsequently performed and its findings are under separate cover.

Review of regulatory agency databases identified the Site on the Emergency Response Notification System (ERNS) database, which is a record of spills of hazardous materials reported to the United States Environmental Protection Agency (USEPA). No further information regarding spills of hazardous materials was available.

Review of regulatory agency databases identified three facilities with active New York Spills/Leaking Underground Storage Tanks (NY Spills/LTANKS) cases that are considered RECs. Two of the three spills have the same address as facilities listed in the Resource Conservation and Recovery Information System Generators/Transporters (RCRIS Gen/Trans) database.

A review of Site history, regulatory agency records, and observations made during a field screening of geotechnical alignment soil borings indicate that contamination, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polychlorinated biphenyls (PCBs) may be present in subsurface soil and groundwater.

3.0 PHYSICAL SETTING

Site M is situated in an area (see Figures 1 and 2) that was originally nearby the historic shoreline of the Hudson River located near the present Eleventh Avenue. Through urban developments, which began in the mid-1800s, the area was extended toward the shoreline and beyond the present Eleventh Avenue, and was filled with soil, rock and miscellaneous debris to create land that was utilized in the late 1800s by a "Chinese Laundry", and then later as a gas station and an automobile repair shop (Sanborn Fire Insurance Maps). CC Truck Rental is the present owner of Site M and operates a truck rental business, utilizing the building for offices and the parking lot as for vehicle storage.

3.1 Topography

Based on a review of the United States Geological Survey (USGS) 7.5-Minute Quadrangle Map, *Weehawken and Jersey City, New Jersey-New York, Central Park, New York – New Jersey, and Brooklyn, New York Quadrangles*, the elevation of the Site is approximately 25 feet above mean sea level. The site reconnaissance revealed the Site to be on a gently sloping plain, with a slight gradient to the west. The PB Team's review of the USGS map indicated that the area's general topographic gradient is to the west. A copy of the topographic map is presented in Figure 1.

3.2 Geology

Site M is underlain by the Manhattan Prong of the New England Uplands physiographic province. The bedrock of the Manhattan Prong underlies much of southwestern Connecticut, Westchester County, New York, and New York City, and ends at the southern tip of Manhattan Island. Three distinct metamorphic rock formations make up the Manhattan Prong; known collectively as the New York City Group. These formations are: the highly folded and contorted Fordham gneiss, the oldest and most widespread of the formations; the Inwood marble, derived from dolomitic limestone; and the younger Manhattan Formation, consisting largely of mica schist, overlying the Inwood marble and making up most of the rock outcrops on Manhattan Island. The soils are mostly acidic, shallow to deep, and rocky (Baskerville 1989). Surficial geology in the vicinity of the Site M is expected to consist of Pleistocene deposits of till and stratified drift, overlain by Holocene deposits. The till was deposited as ground moraine, is less than 25 feet thick in most places and is discontinuous, while Holocene deposits consist of salt marsh deposits, alluvium and shoreline or beach deposits. These sediments consist of sand, gravel, silt, organic silt, peat, loam and shells. Artificial fill overlies most Holocene deposits and contains various mixtures of soil (Baskerville 1989).

3.3 Hydrology

Manhattan Island is underlain by pre-Cambrian metamorphic rocks which have been tightly folded and subsequently eroded. In most places, these pre-Cambrian rocks are overlain by a thin covering of Pleistocene deposits, consisting chiefly of till. The rock beneath most of the island is the Manhattan schist. Manhattan schist contains some joints, irregular fractures and faults along which groundwater moves, but in some places chemical weathering has filled these openings with clay. The Manhattan schist underlies more than three-fourths of Manhattan, but it is not considered to be an important source of groundwater since openings in the bedrock that yield water through joints and fractures are minimal (Perlmutter and Arnow 1953). Due to the thinness and low permeability of the Pleistocene till, water yields are low. However, there are two large bodies of stratified drift in Manhattan that contain and yield considerable groundwater. Neither of these bodies, which are associated with the prominent depressions in the bedrock

surface, is located in close proximity to the Site M. One is located in northern Manhattan (extending from 96th Street and the East River to about 145th Street and the Hudson River), while the other is located in southern Manhattan (all of the island south of 14th Street) (Perlmutter and Arnow 1953).

Based on a review of existing information, groundwater beneath Site M is expected to flow to the west, ultimately discharging into the Hudson River, located approximately 1,000 feet west of Site M. Surface drainage, based on identified topography, flows west from Site M. Estimated groundwater levels and/or flow direction(s) may vary due to seasonal fluctuations in precipitation, local usage demands, geology, underground structures, or dewatering operations. Stormwater runoff from the Site M is expected to drain into stormwater drains located along West 41st Street and Tenth Avenue. Based on a review of the 1975 New York State Department of Environmental Conservation (NYSDEC) Freshwater Wetlands Map, New York County, Map 2 of 4, no wetlands that are regulated under the Freshwater Wetlands Act are present in the Borough of Manhattan. A review of National Wetlands Inventory (NWI) information indicated that no wetlands were present on or adjacent to the Subject Property. The Federal Emergency Management Agency's digital Q3 flood data for Site M were reviewed. The Q3 data indicated the Subject Property is located outside the 100-year and 500-year flood boundaries. Digital Q3 flood data are developed by scanning the existing Flood Insurance Rate Map (FIRM) hardcopy, vectorizing a thematic overlay of flood risks. Vector Q3 flood data files contain only certain features from the existing FIRM hardcopy and are contained in one single countywide file, including all incorporated and unincorporated areas of a county. Digital Q3 flood data are designed to support planning activities, some Community Rating System activities, insurance marketing, and mortgage portfolio reviews. The file does not provide base flood elevation information; thus, it has limited application for engineering analysis, particularly for site design. The product is a valuable tool however in screening property addresses within a Geographic Information System to determine flood risks.¹²

4.0 TECHNICAL OVERVIEW

The field effort for the Phase II ESA was performed from December 21 to December 22, 2005 and consisted of the advancement of ten (10) environmental soil borings and sampling of three (3) groundwater monitoring wells in accordance with the Work Plan (PB, 2005). Deviations from the Work Plan are described within the following paragraphs.

An asbestos inspection and material survey was also performed and its findings are under separate cover.

4.1 Environmental Soil Sampling

Ten environmental soil borings were advanced at the Site and were identified as borings GP-1 through GP-10. The soil boring locations are presented on Figure 3.

Project representatives performed utility clearance notification prior to drilling. After the boring locations were selected, and cleared of obstructions, the soil borings were initiated by hand auguring to a depth of 5 feet (where possible) below the ground surface (ftbgs) to provide an additional level of protection against disrupting any unknown utilities buried below the surface.

Soil samples were collected for laboratory analysis from each of the borings.

Drilling was performed by Precision Sampling, Inc. of Yorktown, NY and ZEBRA Environmental of Lynbrook, NY.

All borings were advanced to a refusal, which was encountered at approximate depths of 15 to 30 feet below the ground surface. At locations where shallow refusals were encountered, repeated attempts were made to reach the anticipated depth of the bedrock. The depth of deep refusals during this investigation was consistent with the anticipated depth of the bedrock (with the exception of GP-5 - see below). One common characteristic of all sampling locations at this site was a very significant thickness of structural fill composed primarily of construction debris (up to 16 feet). At location GP-5, at the center of the northern section of the site, the entire sampling column from the grade to 16' below grade (BG) was composed of construction debris, with a refusal at 16' BG likely due to the debris.

Soil samples were retrieved using 4-foot long, 2-inch diameter Macro-Core samplers advanced continuously from the grade to the refusal. The recovered soils were lithologically classified using the Burmister field soil classification system. Boring logs were generated for each location, and are provided in Appendix A and soils encountered are described in Section 3.2.

During the advancement of the soil borings, a PB Team member visually inspected and continuously screened recovered soil samples and soil cuttings for organic vapors using a 10.2 eV photo-ionization detector (PID). There were no visual or olfactory indicators of contamination observed in soil recovered from the soil borings. Soil PID screening results are provided on the boring logs in Appendix A.

The soil borings were installed to investigate potential impacts associated with historic usage and current spills.

Samples were analyzed for VOCs, SVOCs, TAL Metals, Pesticides/Herbicides (only for samples to be collected from the depth interval of 0 to 6 ftbgs), PLM Asbestos and PCBs identified in the

NYSDEC TAGM HWR-4046 and RCRA Waste Characteristics (i.e., toxicity, reactivity, corrosivity, and flammability).

Soil samples were collected in laboratory-supplied glassware, were labeled with the project name, sample location, time of collection, and stored at a temperature below 4°C prior to delivery to American Analytical Laboratories LLC of Farmingdale, NY for laboratory analyses.

Following completion of the soil borings, and collection of groundwater samples as described in Section 4.2, the drilling contractor grouted the soil borings to the surface and restored the surface with like materials (e.g., asphalt or concrete).

4.2 Groundwater Sampling

As part of this Phase II ESI for Site M, a groundwater sampling program has been implemented to assess groundwater quality. Contaminants in groundwater at Site M may be present as a result of the contaminant leaching from historic fill material, leaching from hazardous materials or petroleum products released as part of the historic usage of Site M, releases from former on-site USTs, and releases from surrounding properties. The groundwater sampling plan included both the installation of temporary groundwater monitoring points, and sampling of existing monitoring wells to permit the collection groundwater samples for laboratory analyses.

Three (3) groundwater samples have been collected. The wells were sampled using a peristaltic pump and polyethylene tubing. Prior to sampling, the wells were purged using a submersible groundwater pump. The purge amount equaled 3 well volumes. Groundwater samples were containerized in laboratory-supplied, pre-preserved sample bottles. Each bottle was labeled with the project name, sample location, time of collection, and stored at a temperature below 4°C prior to delivery to the laboratory for analyses.

The groundwater samples were shipped to American Analytical Laboratories LLC of Farmingdale, NY for analysis of VOCs, SVOCs, TAL Metals, and PCBs. Additionally, samples were analyzed for NYCDEP Limitations for Effluent to Sanitary or Combined sewers.

5.0 RESULTS

The soil analytical data results were compared to the NYSDEC TAGM HWR-94-4046 Recommended Soil Cleanup Objectives (RSCOs). The TAGM provides a basis to determine soil cleanup levels at hazardous waste and spill sites when the Director of NYSDEC's Division of Environmental Remediation determines that cleanup of a site to predisposal conditions is not possible or feasible. The TAGM RSCOs were compared to Phase II ESI laboratory results to determine if the soil is contaminated. Laboratory summary pages are provided as Appendix B and Tables 1 through 4 present a summary of the soil analytical laboratory results. The soil boring logs describing the soil types and fill materials encountered are provided in Appendix A.

The groundwater analytical data results are summarized in Tables 5 through 8, and the laboratory summary pages are provided in Appendix B. The field duplicate sample was collected from the TWP installed in soil boring S-2. The results of the groundwater analyses were compared to the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, as well as the NYCDEP Limitations for Effluent to Sanitary or Combined and Storm Sewers (Limitations for Effluent to Sewers).

5.1 Soil Sample Results

Volatile Organic Compounds (VOCs)

The laboratory results for VOCs in soil are summarized in Table 1. Acetone above TAGM RSCO levels were detected in boring GP-1. Acetone is a common laboratory contaminant from sample handling rather than represent conditions in soil at the Site, although it possible to have residual acetone present from a previous site use. It is important to notice that a possibility for the presence of VOC and SVOC contaminants exists in the northern part of the Site, as indicated by the groundwater sampling results (GW-1). However, geologic the concentrations detected in groundwater are rather low and may be caused by migration from off-site sources.

Semi-Volatile Organic Compounds (SVOCs)

The laboratory results for SVOC analysis for soil are presented in Table 2. SVOCs above TAGM RSCO levels were detected in samples from locations GP-2, 7 and 6. At all locations SVOC contamination was concentrate at depth exceeding 12' BG. At location GP-1, the concentrations of SVOCs, although not in exceedence of the TAGM Soil Cleanup Objectives, have exceeded US EPA health-based criteria. The following SVOCs were detected in soil at concentrations exceeding the TAGM RSCOs :

- Benzo(a)anthracene (GP-2, GP-7, GP-6)
- Benzo(a)pyrene (GP-2 & GP-6)
- Benzo(b)fluoranthene (GP-2, GP-6 & GP-7)
- Benzo(k)fluoranthene (GP-2)

- Chrysene (GP-2, GP-6)
- Dibenzo(a,h)anthracene (GP-2)
- Indeno(1,2,3-c,d)pyrene (GP-2)

No other SVOCs were detected at concentrations exceeding the TAGM RSCOs in soil samples. The detected SVOCs include known or suspected carcinogens and systematic toxins. Provisions must be made to ensure proper protection of the workers during construction activities.

Metals

The laboratory results for metals analysis for soil are presented in Table 3. Metals at or above TAGM RSCO were detected in samples from the majority of borings throughout the site. The following metals were detected in soil at concentrations exceeding the TAGM RSCOs:

- Lead (GP-2 – above upper limit of normal industrial background)
- Mercury (GP-1, GP-2, GP-3, GP-4, GP-7, GP-10)
- Iron (all locations)
- Nickel (GP-2, GP-10, GP-6)
- Copper (GP-2, GP-4)
- Chromium (GP-1, GP-2, GP-3, GP-4, GP-6, GP-7, GP-9, GP-10)
- Cadmium (GP-5)
- Barium (GP-2, GP-4)
- Arsenic (GP-7)
- Zinc (all locations)

No other metals were detected at concentrations exceeding the TAGM RSCOs in soil samples. For some metals detected, including aluminum, calcium, lead, magnesium, manganese, potassium, and sodium, the TAGM RSCO is listed as "site background" only. Background concentrations of Iron vary widely, it's toxicity very low or none in most forms, and it should not be considered and contaminant of concern on this site.

The presence of the TAL metals on this site will require implementation of proper dust suppression and dust control systems during construction activities. Additionally, it is recommended to perform personnel exposure assessment during the excavating and blasting activities.

Polychlorinated Biphenyls (PCBs) and Pesticides

The laboratory results for the PCB analysis for soil are summarized in Table 3. PCBs were not detected in the soil samples analyzed.

Results for the pesticide analyses for soil are summarized in Table 4. The pesticide 4,4'-DDT was detected in soil samples from GP-4, considerably exceeding both exceed the TAGM RSCOs and US EPA health-based criteria.

A highly toxic pesticide Chlordane was detected at locations GP-3, GP-4 and GP-5 in concentrations exceeding TAGM RSCOs.

The pesticide Heptachlor was detected at location GP-3 in concentrations exceeding TAGM RSCOs.

Considering the fact that soil samples were collected as depth composites, a possibility exists for very high, localized concentrations of the above pesticides at shallow depth. A comprehensive field screening and sampling program must be implemented by the Contractor to protect workers from exposure to the pesticides during construction activities.

RCRA Hazardous Waste Characteristics

The laboratory results for the RCRA Hazardous Waste Characteristics for soil are summarized in Table 4. The soil samples were analyzed for flashpoint, reactivity and corrosivity. Results of these analyses revealed that the soil samples did not exhibit characteristics of RCRA hazardous waste.

Due to high concentrations of metals in soil samples, a composite sample was submitted for TCLP analysis for TAL Metals. No parameters were found to exceed regulatory limits for disposal as non-hazardous waste.

Summary of Soil Sampling Results

The laboratory results indicate that the soils at the Site contain elevated concentrations of SVOCs, pesticides and metals. The compounds detected are commonly present in fill materials located throughout New York City. The absence of high concentrations of target contaminants in the groundwater samples indicates the likelihood of relatively small-quantity localized releases of SVOC and pesticides on-site, as well as the presence of high levels of metals in the structural fill used to raise the surface elevation of the site. The NYSDEC *may* not permit reuse of soil excavated from the site due to the elevated concentrations of SVOCs and metals. Based on the results of the laboratory analysis, the subsurface material excavated during construction would likely be classified as non-hazardous waste if it is determined that off-site disposal is required.

Analysis for RCRA Characteristics revealed that site soils would not be considered RCRA hazardous waste.

5.2 Groundwater Sampling Results

Volatile Organic Compounds (VOCs)

The results of the VOC analysis for groundwater are presented in Table 5. The BTEX VOCs were detected in sample GW#1 (location GP-2 - North Side of the site) and benzene was detected in Sample GW#2 at a concentration exceeding the NYSDEC Groundwater Standards, but NOT exceeding NYCDEP Limitations for Effluent to Sewers. Since the groundwater at the site will not be used for human consumption and there are no sensitive ecological receptors in the area, the results indicate the possibility of direct discharge of the effluent of any dewatering operation into sanitary sewer (provided that all other NYCDEP criteria are met).

Semi-Volatile Organic Compounds (SVOCs)

A summary of the SVOC results for groundwater are presented in Table 6. SVOCs were NOT detected in any groundwater samples in concentrations exceeding either of the two referenced standards.

Metals

A summary of the metals results is presented in Table 7.

No metals were detected at concentrations exceeding applicable discharge limits, with the exception of Zinc. Processing of effluent water in sedimentation tanks is likely to lower the concentration of Zinc below regulatory limits.

Polychlorinated Biphenyls (PCBs)

A summary of the analytical results for PCB analysis is presented in Table 7. PCBs were not detected in the groundwater samples.

NYCDEP Sewer Discharge Requirements(excluding contaminant concentration listed above)

A summary of the laboratory results for these analyses is presented in Table 8. Laboratory analytical results for the groundwater samples revealed that the samples did not contain concentrations of hexavalent chromium, or exhibited pH that exceed the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers. The total suspended solids values were in excess of NYCDEC limits, indicating the need for sedimentation tanks as a part of the effluent treatment system on site.

Summary of Groundwater Sampling Results

The results of the laboratory analyses of groundwater revealed that in the northern section of the Site, slight VOC and metal contamination is present in the groundwater. However, none of the parameters (with the exception of Zinc and Total Suspended Solids(TSS)) exceed the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers criteria for discharge into sanitary or combined sewers. The elevated concentrations of Zinc, as well as elevated TSS values can be removed by the use of a sedimentation tanks prior to discharge into the sewer.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The following activities were performed for the Phase II ESI:

- Advancement of ten environmental soil borings;
- Collection of ten (10) grab and composite soil samples for laboratory analyses; and
- Collection of three (3) groundwater samples for laboratory analyses.

The following conclusions are based on field observations and laboratory results obtained from the investigation. Based on the conclusions recommendations are provided with regard to provisions for worker and community health and safety, as well as for handling and disposal of soil and groundwater encountered during the construction activities.

6.1 Soils

The laboratory results indicate that the soils at the Site contain elevated concentrations of SVOCs, pesticides and metals. The compounds detected are commonly present in fill materials located throughout New York City. The absence of high concentrations of target contaminants in the groundwater samples indicates the likelihood of relatively small-quantity localized releases of SVOC on-site, as well as the presence of high levels of metals in the structural fill used to raise the surface elevation of the site. The NYSDEC *may* not permit reuse of soil excavated from the site due to the elevated concentrations of SVOCs and metals. Based on the results of the laboratory analysis, the subsurface material excavated during construction would likely be classified as non-hazardous waste if it is determined that off-site disposal is required.

Prior to construction, the Contractor is required to prepare an Environmental Assessment Report (EAR), which shall include pre-construction characterization of all materials to be generated during construction. Based on our previous experience, determination as to reuse options will be made by NYSDEC based on sampling results of excavated and stockpiled material. The contractor should be prepared to handle the costs and logistics of off-site disposal of excavated contaminated soil.

The proposed excavation will extend into the bedrock, to depths in excess of the maximum depth achieved during the Phase II assessment. A possibility exists for contaminants to be present in the fractured bedrock below the Site M; however, based on results of this study the possibility of this is very low. The Contractor will be required to prepare a Site-Specific Health and Safety Plan and Site-Specific Soil Management Plan to address the handling and management of soil excavated from the Site during the construction activities. Due to the extent of excavation and proposed construction activities at the Site, off-site disposal of soil is expected. The laboratory results indicate that soil would likely be classified as non-hazardous waste.

6.2 Groundwater

The results of the laboratory analyses of groundwater revealed that in the northern section of the Site, slight VOC and metal contamination is present in the groundwater. However, none of the parameters (with the exception of Zinc and Total Suspended Solids(TSS)) exceed the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers criteria for discharge into

sanitary or combined sewers. The elevated concentrations of Zinc, as well as elevated TSS values can be removed by the use of a sedimentation tanks prior to discharge into the sewer.

6.3 Additional Investigation

The proposed excavation will extend into the bedrock, to depths in excess of the maximum depth achieved during the Phase II assessment. A possibility exists for contaminants to be present in the fractured bedrock below the Site M; however, based on results of this study the possibility of this is very low. Therefore, additional investigation is NOT recommended for this site.

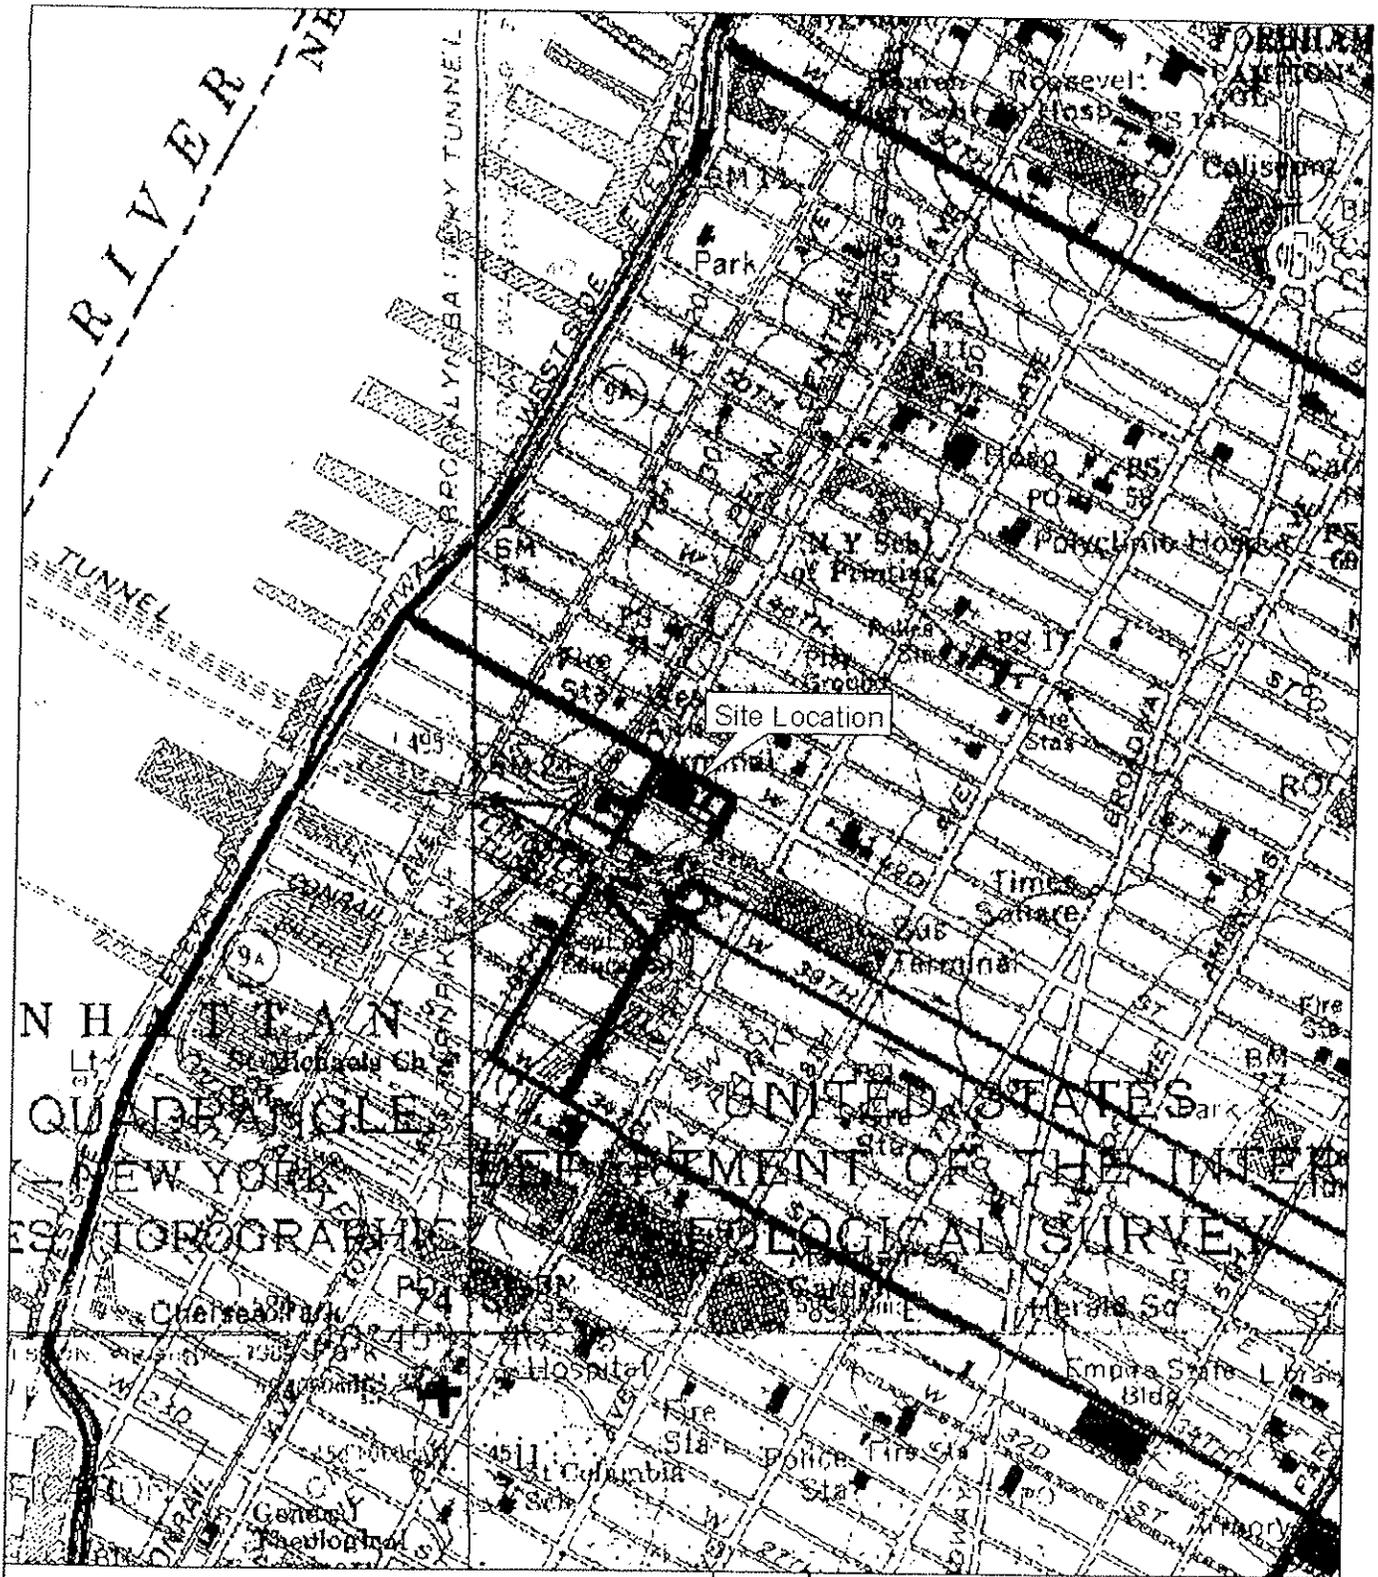

6.4 Health and Safety

The Contractor is required to prepare a Site-Specific Health and Safety Plan and Site-Specific Soil Management Plan to address the handling and management of soil excavated from the Site during the construction activities. The presence of high concentrations of carcinogenic SVOCs, persistent pesticides such as 4,4'-DDT and Chlordane and heavy metals in the soil samples indicates the need to develop a site-specific Exposure Assessment, Personal Protective Equipment, Ambient Air Monitoring and Dust Control Plans.

8-12'	N/A	Rocks and concrete intermixed with brown silty sand, wet.	0.0
12-16'	N/A	Wet brown sand with some silt, some rock fragments.	0.0
16-20'	N/A	Saturated gray sandy silt, some rocks.	0.0
20-24'	N/A	Saturated gray sandy silt, some rocks, some organic layering.	0.0
24-28'	N/A	Saturated gray sandy silt, some rocks, some weathered Schist.	0.0
28-30'	N/A	Saturated weathered Schist with some gray sandy silt. Refusal at 30' BG.	0.0
26-30'	N/A	Collected GW sample. Very slow recharge.	0.0

SOIL BORING LOG

Date: 12/22/2005
Site ID: 7West/Site M
Borehole ID: GP-10
Rig: Geoprobe 6600
Tooling: MC
Lead Driller: Rick Lyons, ZEBRA Environmental
Geologist: A. Nadolishny
Weather: 38F, clear

Depth feet BGS	N values/ Blow Counts	Soil Description	PID reading
0-6"	N/A	Asphalt	0.0
0-4'	N/A	No recovery	0.0
4-8'	N/A	Gravel, ash, cinder, crushed schist	0.0
8-12'	N/A	Gravel, ash, cinder, crushed schist	0.0
12-16'	N/A	Gravel, crushed schist, some sand	0.0
16-20'	N/A	Wet light brown fine sand	0.0
20-24'	N/A	Wet light brown fine sand, transition at 23' BG into dark brown silty sand with some weathered schist	0.0
24-28'	N/A	Dark brown wet sand with some schist. Refusal at 27.9' BG	0.0

APPENDIX B

UNICO
SERVICE CORP.

June 12, 1995

NYC

NO

The Estate of Sol Goldman
640 Fifth Avenue
New York, New York 10019

Attention: Mr. John Amisano
Director of Construction & Development

Reference: Fast Towing & Auto Repair
547 10th Avenue
Manhattan, New York

Gentlemen:

Thank you for allowing us to submit our bid to abandon approximately seven (7) existing underground storage tanks totaling 5700 gallons.

- We propose to excavate over all tanks, remove all product, sludge and dispose of same.
- Cut and clean all tanks and fill tanks with concrete slurry.
- Furnish and install approximately seven (7) test wells per D.E.C. requirements.
- Provide the environmental technician to take the necessary soil samples for analytical and final D.E.C. report.
- Restore the disturbed areas with asphalt.
- The removal of contaminated soil or hazardous product is not included in our bid.

The cost to complete the above mentioned work is Thirty Four Thousand Dollars (\$34,000.00), plus applicable tax.

You will notice that in this particular case, the abandoned tanks cost more than the actual removal of all tanks.

If the owner ever decided to sell the property, he would still be obligated to remove the existing tanks.

Gentlemen:

We are submitting our proposal to complete the following scope of work.

1. Excavate, cut and clean existing tanks. Remove and dispose of approximately seven (7) tanks totaling 5700 gallons.
2. Obtain necessary D.E.C. soil sample/report.
3. Removal of product and sludge in all tanks (not hazardous).
4. Backfill excavation with pea gravel.
5. Restore disturbed areas with asphalt.

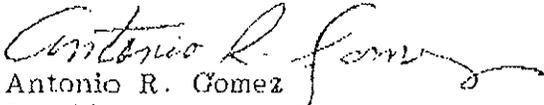

Our cost to complete the above mentioned work is Eighteen Thousand Eight Hundred Seventy Five Dollars (\$18,875.00), plus applicable tax.

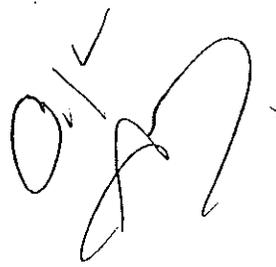

This proposal does not include the removal of any contaminated soil or hazardous product.

We hope you find our proposal of interest and will allow us to work with you on this project.

Cordially yours,

2009 Enhancements to EDR City Directory Abstract

New for 2009, the EDR City Directory Abstract has been enhanced with additional information and features. These enhancements will make your city directory research process more efficient, flexible, and insightful than ever before. The enhancements will improve the options for selecting adjoining properties, and will speed up your review of the report.

City Directory Report. Three important enhancements have been made to the EDR City Directory Abstract:

1. *Executive Summary.* The report begins with an Executive Summary that lists the sources consulted in the preparation of the report. Where available, a parcel map is also provided within the report, showing the locations of properties researched.
2. *Page Images.* Where available, the actual page source images will be included in the Appendix, so that you can review them for information that may provide additional insight. EDR has copyright permission to include these images.
3. *Findings Listed by Location.* Another useful enhancement is that findings are now grouped by address. This will significantly reduce the time you need to review your abstracts. Findings are provided under each property address, listed in reverse chronological order and referencing the source for each entry.

Options for Selecting Adjoining Properties. Ensuring that the right adjoining property addresses are searched is one of the biggest challenges that environmental professionals face when conducting city directory historical research. EDR's new enhancements make it easier for you to meet this challenge. Now, when you place an order for the EDR City Directory Abstract, you have the following choices for determining which addresses should be researched.

1. *You Select Addresses and EDR Selects Addresses.* Use the "Add Another Address" feature to specify the addresses you want researched. Your selections will be supplemented by addresses selected by EDR researchers using our established research methods. Where available, a digital map will be shown, indicating property lines overlaid on a color aerial photo and their corresponding addresses. Simply use the address list below the map to check off which properties shown on the map you want to include. You may also select other addresses using the "Add Another Address" feature at the bottom of the list.
2. *EDR Selects Addresses.* Choose this method if you want EDR's researchers to select the addresses to be researched for you, using our established research methods.
3. *You Select Addresses.* Use this method for research based solely on the addresses you select or enter into the system.
4. *Hold City Directory Research Option.* If you choose to select your own adjoining addresses, you may pause production of your EDR City Directory Abstract report until you have had a chance to look at your other EDR reports and sources. Sources for property addresses include: your Certified Sanborn Map Report may show you the location of property addresses; the new EDR Property Tax Map Report may show the location of property addresses; and your field research can supplement these sources with additional address information. To use this capability, simply click "Hold City Directory research" box under "Other Options" at the bottom of the page. Once you have determined what addresses you want researched, go to your EDR Order Status page, select the EDR City Directory Abstract, and enter the addresses and submit for production.

Questions? Contact your EDR representative at 800-352-0050. For more information about all of EDR's 2009 report and service enhancements, visit www.edrnet.com/2009enhancements

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2006. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 100 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

New York, New York 10007

Re: *Freedom of Information (FOI) Request*
547-551 10th Avenue
Block 1069, Lot 34
New York, New York

Dear Sir or Madam:

Atlantic Environmental Solutions, Inc. (AESI) has been retained to perform an environmental assessment of the referenced property. The purpose of this letter is to request any information which may be in your files in connection with the subject properties. Please review your files for any of the following:

- Environmental violations, incidents, complaints, etc.
- Community Right to Know (RTK) Information
- Underground Storage Tank (UST) registrations, installation or removal permits
- Hazardous substance (including petroleum) discharges, leaks, spills, etc.
- Monitoring well, potable well, or other well installation records
- Industrial Site Recovery Act (ISRA) or ECRA correspondence
- Groundwater contamination reports, including Classification Exception Areas (CEAs)
- Declaration of Environmental Restrictions (DERs)
- Hazardous Substance Inventories
- Air emission permits, records
- Solid waste or sanitary waste permits, records

Thank you in advance for your help regarding this matter. In the event that there is a fee associated with obtaining this information, or if your office would rather make the file available for my review, please do not hesitate to contact me at (201) 876-9400. Our fax number is (201) 876-9563.

Sincerely,

Re: Freedom of Information (FOI) Request
547-551 10th Avenue
Block 1069, Lot 34
New York, New York

Dear Sir or Madam:

Atlantic Environmental Solutions, Inc. (AESI) has been retained to perform an environmental assessment of the referenced property. The purpose of this letter is to request any information which may be in your files in connection with the subject properties. Please review your files for any of the following:

- Environmental violations, incidents, complaints, etc.
- Community Right to Know (RTK) Information
- Underground Storage Tank (UST) registrations, installation or removal permits
- Hazardous substance (including petroleum) discharges, leaks, spills, etc.
- Monitoring well, potable well, or other well installation records
- Industrial Site Recovery Act (ISRA) or ECRA correspondence
- Groundwater contamination reports, including Classification Exception Areas (CEAs)
- Declaration of Environmental Restrictions (DERs)
- Hazardous Substance Inventories
- Air emission permits, records
- Solid waste or sanitary waste permits, records

Thank you in advance for your help regarding this matter. In the event that there is a fee associated with obtaining this information, or if your office would rather make the file available for my review, please do not hesitate to contact me at (201) 876-9400. Our fax number is (201) 876-9563.

Sincerely,

Seamus Kelly

**Re.: Spill at 547 10th Avenue
Manhattan, NY
Spill Case #: 9503865**

Dear Mr. Nitu,

On 06/29/1995, the New York State Department of Environmental Conservation (the Department) was notified that petroleum contaminated soil was discovered at the above referenced site. On 09/19/2008, the Department sent a letter requiring submission of a Phase I and a soil/groundwater investigation report (letter attached). As of today, the Department has not received these reports.

If the Department does not receive required documents by July 02, 2010, the case will be referred to the NYSDEC Region 2 Office of General Counsel.

The Department holds the responsible party liable for addressing any on- or off-site contamination associated with this spill case. Under the New York State Environmental Conservation Law (ECL) and/or the New York State Navigation Law (NL), any person who discharges petroleum and fails to promptly clean up such prohibited discharge may be subject to a penalty of up to \$37,500 per day per violation.

If you have any question, please call me at (718) 482-7366.

Sincerely,

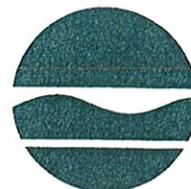

Hiralkumar Patel

New York, NY 10019
Attn.: Ronald Lichtman

Re.: Spill at 547 10th Avenue
Manhattan, NY
Spill Case #: 9503865

Project Manager: Hiralkumar Patel

Dear Mr. Lichtman,

On 06/29/1995, the New York State Department of Environmental Conservation (the Department) was notified that petroleum contaminated soil was discovered, during removal of underground gasoline storage tanks, at the above referenced site.

To rectify this problem, the Department requires the following:

1. Submission of a Phase I:

The Department requires submission of a Phase I, according to DER-10 (Technical Guidance for Site Investigation and Remediation, available at <http://www.dec.ny.gov/regulations/2393.html>) Appendix 3A.

2. Delineation of Soil Contamination:

The Department requires that soil contamination be completely delineated via the collection of soil samples and groundwater samples. As part of the complete horizontal and vertical delineation requirement, soil will initially be sampled continuously with a PID around previous tank systems including remote fill ports, piping and dispenser islands. At a minimum, soil must be sampled to a depth of ten feet below the previous tank invert. *The deepest dry soil sample and the sample with the highest PID reading* will be sent to a NYSDOH certified laboratory for EPA Method 8260/8270 analyses and the results will be sent to the Department. *If no elevated PID readings are found then the two deepest dry soil samples* will be submitted for analyses. A water sample will be obtained at the boring location and submitted for EPA Method 8260/8270 analyses. Prior to installation, all utilities will be located and marked out. Additional borings/monitoring wells may be necessary based upon review of the investigation report.

If contaminated groundwater is discovered, then the Department will require the following:

1. Delineation of Soil and Groundwater Contamination via Installation of Monitoring Wells:

The Department requires complete delineation of groundwater contamination via installation of monitoring wells. As per DER-10 (Technical Guidance for Site Investigation and Remediation), available at <http://www.dec.ny.gov/regulations/2393.html>, 3.7.2 (b) 4.i: "A minimum of three groundwater monitoring wells or piezometers are required in each affected aquifer or water bearing

zone to determine the groundwater flow direction in that zone. The monitoring wells or piezometers must be properly installed and surveyed relative to a permanent surface structure to provide for adequate triangulation.” During installation of the monitoring wells, soil will be sampled continuously with a PID. *The deepest dry soil sample and the sample with the highest PID reading* will be sent to a NYSDOH certified laboratory for EPA Method 8260/8270 analyses and the results will be sent to the Department. *If no elevated PID readings are found then the two deepest dry soil samples* will be submitted for analyses. Water samples will be analyzed for EPA Method 8260/8270 analyses. Prior to installation, all utilities will be located and marked out. Additional borings/monitoring wells may be necessary based upon review of the investigation report.

An investigation report must be submitted to the Department including: scaled site plan with sampling locations, boring logs, well installation logs (if applicable), sample analyticals, site observations, conclusions and recommendations. The report must be **submitted to this office no later than two months from the date of this letter**. It should be sent to my attention, referencing the spill case number and the site address. A remedial action plan may be required based on the results of the investigation.

The Department holds the responsible party liable for addressing any on- or off-site contamination associated with this spill case. Under the New York State Environmental Conservation Law (ECL) and/or the New York State Navigation Law (NL), any person who discharges petroleum and fails to promptly clean up such prohibited discharge may be subject to a penalty of up to \$37,500 per day per violation.

If you have any questions, please call me at (718) 482-7366.

Sincerely,

A handwritten signature in black ink, appearing to read "H. Patel", written over a horizontal line.

Re.: Spill at 547 10th Avenue
Manhattan, NY
Spill Case #: 9503865

Project Manager: Hiralkumar Patel

Dear Mr. Lichtman,

On 06/29/1995 the New York State Department of Environmental Conservation (the Department) was notified that petroleum contaminated soil was discovered, during removal of underground gasoline storage tanks, at the above referenced site. This is a violation of Article 12 of the New York State Navigation Law (NL) Section 173 and according to Section 176 you are required to contain and "promptly clean up and remove the discharge." As of today, the Department has not received any subsequent information regarding actions taken at this property to address this violation. Therefore, this case will remain open in our database until the Department receives sufficient information to ascertain that the discharge has been cleaned up.

To rectify this problem, a letter report asserting a cause of the release and summarizing the cleanup activities, observations, post-excavation sampling results, and also including contaminated material disposal manifests or any other documentation (i.e. invoices, bills, etc.) of cleanup activities must be **submitted to this office no later than one month from the date of this letter**. It should be sent to my attention, referencing the spill case number and the site address.

The Department holds the responsible party liable for addressing any on- or off-site contamination associated with this spill case. Under the New York State Environmental Conservation Law (ECL) and/or the New York State Navigation Law (NL), any person who discharges petroleum and fails to promptly clean up such prohibited discharge may be subject to a penalty of up to \$37,500 per day per violation.

Sincerely,

Hiralkumar Patel
Environmental Engineer 1
Spill Prevention & Response Programs

Appendix 3A Records Search Requirements

(a) The first phase of a site characterization should be a records search based on diligent inquiry. A phase I report, prepared prior to a site entering one of the DER remedial programs identified in section 1.2, may be provided in lieu of a records search report, provided it was prepared in accordance with applicable ASTM guidance for preparation of Phase I reports. A records search report should include the following:

1. Historical information concerning the site history should be part of the site assessment. Historical information is not required if the investigation is directed at either a specific discharge event (rather than a particular area of concern) or any underground tank or underground tank system unless directed by the DEC. The site history should include an evaluation of the following to the extent available from diligent inquiry:

i. site history information from sources including, but not limited to, the following:

- (1) Sanborn Fire Insurance Maps;
- (2) MacRae's Industrial Directory;
- (3) title and deed;
- (4) site plans and facility as-built drawings;
- (5) federal, State, county and local government offices; and
- (6) DEC Geographic Information System;
- (7) adjacent property uses

ii. the industrial/commercial site history from the time the site was naturally vegetated or utilized as farmland, including without limitation:

- (1) names of all owners and operators;
- (2) dates of ownership of each owner;
- (3) dates of operation of each operator; and
- (4) brief descriptions of the past industrial/commercial usage of the site by each

owner and operator;

iii. all raw materials, finished products, formulations and hazardous substances, hazardous wastes, and petroleum products which are or were present on the site, including intermediates and by-products;

iv. present and past production processes, including dates, and their respective water use should be identified and evaluated, including ultimate and potential discharge and disposal points and how and where materials are or were received onsite (for example, rail, truck);

v. all former and current containers, container or bulk storage areas, above and below ground tanks, above and below ground waste and product delivery lines, surface impoundments, landfills, septic systems and other structures, vessels, conveyances or units that contain or previously contained hazardous substances, hazardous waste, and petroleum products, including:

- (1) type;
- (2) age;
- (3) dimension of each container;
- (4) location;
- (5) chemical content;
- (6) integrity (for example, tank test reports);
- (7) volume;
- (8) construction materials; and
- (9) inventory control records to include records of leak detection system

inspections, where there is no discharge history;

vi. an interpretation of the aerial photographic history of the site, based on available current and historical color, black and white and infrared aerial photographs (scale 1:17,000 or less) of the site and surrounding area at a frequency which provides the evaluator with a historical perspective of site activities. The photographic history should date back to 1932 or to the earliest photograph available.

vii. any data or information concerning known discharges that have occurred on the site;

viii. remediation activities previously conducted or currently underway at the site including dates of previous discharges, remedial actions, and all existing sampling data concerning contaminants at the site. If a government agency was involved, the name of the lead government agency, case identification number, and current case status;

ix. all remedies previously approved by the DEC in a remedial action work plan or decision document to determine if the remedy remains protective of human health and the environment;

x. all existing environmental sampling data concerning contaminants at the site;

xi. any known changes in site conditions or new information developed since completion of previous sampling or remediation;

xii. all Federal, State and local environmental permits including permits for all previous and current owners or operators, applied for or received, or both, for the site including the:

- (1) name and address of permitting agency;
- (2) reason for the permit;
- (3) permit identification number;
- (4) application date;
- (5) date of approval, denial, or status of application;
- (6) name and current address of all permittees;
- (7) reason for denial, revocation or suspension if applicable; and
- (8) permit expiration date;

xiii. all administrative, civil and criminal enforcement actions for alleged violations of environmental laws concerning the site, including:

- (1) the name and address of agency that initiated the enforcement action;
- (2) the date of the enforcement action;
- (3) the section of statute, rule or permit allegedly violated;
- (4) the type of enforcement action;
- (5) a description of alleged violations;
- (6) the resolution or status of violation and enforcement action; and
- (7) a description of any potential environmental impact which may have resulted from the alleged violation; and

xiv. all areas where non-indigenous fill materials were used to replace soil or raise the topographic elevation of the site, including the dates of emplacement, where reasonably available, paying particular attention to potential areas of concern as identified in section 1.7.

2. The person conducting the records search should conduct a site visit to verify the findings in paragraph (c)1 above. Where site conditions are not already well known, appropriate monitoring instruments such as Organic Vapor Analyzers (Photo Ionization Detectors, explosimeters), oxygen detectors and radiation detectors should be used to assure personal safety and assist with site characterization.

3. Interviews are to be utilized, where appropriate, taking into consideration the following factors relative to who to interview, how and when they should be conducted:

i. interviews with facility personnel (past and present), adjoining property owners, and persons familiar with past activities at the site can be useful in determining if and where hazardous waste/substances, or petroleum products were disposed of at the site and what exposure pathways are likely to be at risk. Information obtained during the interview process can supplement other means used in the investigation. However, if the information is crucial to the determination that hazardous waste/substances or petroleum products were disposed of at the site, the documentation outlined in 3.iv (below) is required;

ii. interviews may be conducted in person, by telephone, email or post;

iii. interviews may be conducted prior to, during or after the site reconnaissance, as convenient to the project manager;

iv. interviews must be documented with the date and signature of the person granting the interview. At the end of the interview the person should read and be asked then and there to sign and date the transcript. In cases where a telephone interview was conducted, the project manager should determine during that conversation if the person is willing to sign his/her statements. If so, the project manager will send a transcript to that person for signature thus verifying the conversation. In the case where the person interviewed is unwilling to sign a transcript, or the consultant, after making a reasonable effort (mailing a transcript with a follow-up letter requesting the return), is unable to obtain the person's signature on the transcript, then this statement should not be used or referenced in the report. The person's name, however should be listed in the references section of the report as being contacted during the investigation;

v. areas of inquiry should include the following:

- (1) any pending or past litigation or administrative proceedings regarding hazardous waste/substances or petroleum products on the site;
- (2) any notices from any government agency regarding any possible violation of environmental or safety laws;
- (3) previous environmental assessments or audits;
- (4) environmental permits or registrations;
- (5) safety plans, prevention plans, control plans; and
- (6) reports describing local hydrogeologic conditions;

vi. people to interview should include:

- (1) pertinent DEC and DOH staff;
- (2) past owners, occupants and operators, key managers, former employees;
- (3) site neighbors; and
- (4) local officials, such as elected officials, attorneys, building inspectors; zoning board, planning board, as well as any fire police, health, engineering and environmental DEC's; and

vii. evaluation of interview responses should include the following factors:

- (1) degree of specificity;
- (2) degree of interviewee's knowledge;
- (3) degree of interviewee's good faith;
- (4) completeness;
- (5) documentation; and
- (6) corroboration.

(b) The records search report is prepared in accordance with section 3.12.

Re: 547-551 10th Avenue, New York, NY

Dear Madam/Sir:

This responds to your request for information governed by the Freedom of Information Law (FOIL).

✓ All public records maintained by the Department of Buildings (DOB) are routinely made available for public inspection at the office / division of the New York City Department of Buildings at which said records are maintained. Please contact the **Manhattan Borough Office located at 280 Broadway, 3rd Floor, New York, NY (212) 566-0268** to determine the hours at which the records you have requested are available. Any further questions regarding your request should be directed to the Records Control Officer for the respective office/division of this Department. **The records will not be available at the time you call.**

- The documents you requested are available for inspection at the City Hall Library located at 31 Chambers Street, Suite 112, New York, NY 10007, (212) 788-8590.

- The information you seek is not within the jurisdiction of the Department of Buildings. Please direct your request to

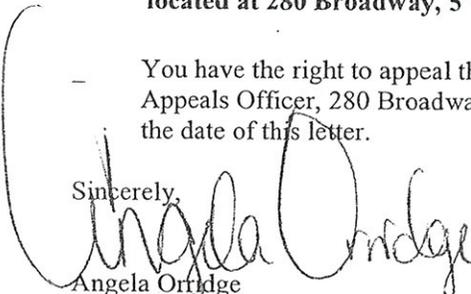

- A search of the Department of Buildings files has revealed no documents.

- Your request is denied under §87(2) of the Public Officer's Law because the documents requested are

✓ **Other: For copies of ECB violations please contact the enforcement Division located at 280 Broadway, 5th Floor, New York, NY (212) 566-3232.**

- You have the right to appeal this determination by writing to Janine Gaylard, FOIL Appeals Officer, 280 Broadway, 7th Floor, New York, NY 10007, within 30 days of the date of this letter.

Sincerely,

Angela Orledge
Records Access Officer

Re: FOIL# 1178
547-551 10th Avenue, New York
Block 1069, Lot 34

Dear Mr. Kelly:

As Records Access Officer for the Department of City Planning, I acknowledge receipt of your requests for environmental information pertaining to the above-mentioned properties.

Please be advised that the Environmental Impact Statement for the Hudson Yards District/Clinton District Follow-up Zoning Text Change is available on the agency's website nyc.gov/planning - go to Projects/Proposals - Manhattan - More, then scroll down to Earlier Rezonings and Studies (it will be the third project) then choose EIS where you will find the Hazardous Chapter. The Department of City Planning does not maintain environmental regulatory information therefore this part of your request is denied. For your information, I have enclosed a list of regulatory agencies you can contact for records relating to environmental issues.

Please be further advised that pursuant to Subdivision 4 of Section 89 of the Public Officers Law and Section 6 of the Uniform Rules and Regulations for All City Agencies pertaining to the Administration of the Freedom of Information Law, you may, within thirty days after receipt of this information, appeal to the Appeals Officer for this agency David Karnovsky, Counsel to the Department of City Planning, Room 2N, 22 Reade Street, New York, N. Y. 10007. Any appeal must be in writing and include the name of the Records Access Officer, the date, the records which were the subject of the request and the name and address of the applicant.

Sincerely,

A handwritten signature in cursive script that reads "Wendy Niles".

Re: *Summary Investigation Report*
547-551 10th Avenue, New York, NY
Tax Block 1069, Lots 29 and 34
NYSDEC Spill Case No. 9503865

Dear Mr. Patel:

On behalf of the property owner, Solil Management, LLC, Atlantic Environmental Solutions, Inc. (AESI) is providing this Summary Investigation Report for the property located at 547-551 10th Avenue in New York, New York ("site" or "subject property"). This report is being provided to address work requested by the New York State Department of Environmental Conservation (NYSDEC) in a September 3, 2010 letter. The NYSDEC requested investigation of subsurface soil and groundwater in the vicinity of hydraulic lifts identified at the property. Enclosed you will find the results of the October 2010 Summary Investigation Report and a Scaled Site Map identifying areas of concern at the property. In addition, the Subsurface Investigation Work Plan required for the former gasoline underground storage tanks (USTs) has been revised and resubmitted per your request.

Please feel free to contact us at 201-876-9400 if you have any questions.

Very truly yours,

Seamus Kelly
Project Manager

Jeffrey W. Anderson, CHMM
Vice President

- Appendix B – Laboratory Data Report: October 6, 2010

1.0 INTRODUCTION

On behalf of Solil Management, LLC, Atlantic Environmental Solutions, Inc., (AESI) prepared a Phase I Environmental Site Assessment for the property located at 547-551 10th Avenue, New York, New York at the request of the New York State Department of Environmental Conservation (NYSDEC). The Phase I report was prepared and submitted to the NYSDEC in lieu of a record search report per Appendix 3A of the Technical Guidance for Site Investigation and Remediation (DER-10).

During preparation of the Phase I, AESI identified a number of Recognized Environmental Conditions (RECs) warranting further investigation. These RECs included an open discharge case (#9503865) relating to the removal of gasoline underground storage tanks (USTs) in 1995 and two (2) in-ground hydraulic lifts inside the former auto service shop.

On September 3, 2010, the NYSDEC issued a letter requesting the following:

- 1) Submission of a Scaled Site Map
- 2) Delineation of Possible Soil Contamination in the Area of Hydraulic Lifts
- 3) Delineation of Soil and Groundwater Contamination via Installation of Monitoring Wells Around the Former Gasoline Tank Systems

The Scaled Site Map (Figure 2) and a summary investigation report (SIR) detailing the investigation of the hydraulic lifts are included in this submittal. The Investigation Work Plan (IWP) required prior to monitoring well installation has been submitted under separate cover.

2.0 SUMMARY OF INVESTIGATION ACTIVITIES

On October 6, 2010, AESI mobilized to the property to perform soil sampling in the vicinity of the hydraulic lifts inside the former auto shop. AESI advanced four (4) soil borings around the two (2) hydraulic lifts. Figure 2 shows the soil boring locations and the soil boring logs are included as Appendix A. The soil borings were advanced using a geoprobe and soil encountered was continuously sampled using macro core liners. During the investigation AESI noted the presence of an in-ground hydraulic oil tank adjacent to the northern-most lift. The tank was accessed and appeared to contain hydraulic oil. Please refer to Figure 2 for a scaled site map showing the former auto shop, former gasoline tanks and dispenser islands and proposed groundwater monitoring wells. Please refer to Figure 3 for the location of the lifts, hydraulic oil tank and soil borings within the former auto shop. Soil boring logs are included at Appendix A.

Soil boring SB-1 was advanced adjacent to the northern most hydraulic lift. The soil boring was advanced to refusal, at approximately six (6) feet below ground surface. The soil was field screened with a Photoionization detector (PID). No petroleum odors or PID reading were detected.

Soil boring SB-2 was advanced to the south of the northernmost hydraulic lift, adjacent to the hydraulic oil cylinder. SB-2 was advanced to a depth of 20 feet below ground surface. Sample SB-2-5 was collected at five (5) feet below ground surface (bgs) and sample SB-2-12 was

collected at 12 feet bgs. Groundwater was encountered at approximately 13 feet bgs. No odors or PID reading were detected at five (5) feet bgs, but staining, odors and a PID reading of 372 parts per million were detected at 12 feet bgs. Staining and a petroleum odor extended to 20 feet bgs. As contamination extended below the water table, AESI collected a groundwater sample, SB-2W.

Soil boring SB-3 was advanced to the south of the southern-most hydraulic lift. The soil boring was advanced to refusal, at approximately seven (7) feet below ground surface. The soil was field screened with a Photoionization detector (PID). No petroleum odors or PID reading were detected.

Soil boring SB-4 was advanced to the east of the southern-most hydraulic lift, towards the front of the former auto shop. SB-4 was advanced to a depth of 20 feet bgs. Sample SB-4-5 was collected at five (5) feet bgs and sample SB-4-13 was collected at 13 feet bgs. Groundwater was encountered at approximately 13 - 14 feet bgs. No odors or PID reading were detected at five (5) feet bgs, but staining, odors and a PID reading of 560 parts per million were detected at 13 feet bgs. Staining and a petroleum odor extended to 20 feet bgs. As contamination extended below the water table, AESI collected a groundwater sample, SB-4W.

All soil and groundwater samples were placed in an ice filled cooler and delivered to a New York State Department of Health (NYSDOH) certified laboratory. The samples were submitted for analysis of volatile organic compounds (VOCs) and semi volatile organic compounds (SVOCs) via EPA methods 8260 and 8270.

3.0 LABORATORY ANALYTICAL RESULTS – OCTOBER 6, 2010

Four (4) soil samples (SB-2-5, SB-2-12, SB-4-5 & SB-4-13) and two (2) groundwater samples (SB-2W & SB-4W) were submitted to Integrated Analytical Laboratories, of Randolph, New Jersey for analysis of VOCs and SVOCs via EPA methods 8260 and 8270. Please refer to Table 1 for a summary of soil results and Table 2 for a summary of groundwater results. The laboratory analytical data report is included as Appendix B.

Laboratory analysis of the soil samples did not identify volatile organic compounds at concentrations in excess of the NYSDEC Recommended Soil Cleanup Objective (RSCO). Semi volatile organic compounds (SVOCs) consistent with historic fill materials were identified in the shallow soil samples at concentrations in excess of the RSCO. Benzo[a]anthracene, chrysene, benzo[a]pyrene and dibenz[a,h]anthracene were identified above standard in SB-2-5 and benzo[a]anthracene was identified above standard in SB-4-5. No SVOCs were identified above standard in the deeper soil samples.

Laboratory analysis of the groundwater samples, SB-2W and SB-4W, identified volatile organic compounds in excess of the NYSDEC groundwater standard in both temporary monitoring wells. SB-2W contained benzene at 9.92 parts per billion (ppb), in excess of the standard of 0.7 ppb. SB-4W contained acetone at 72.7 ppb, in excess of the standard of 50 ppb; benzene at 76.1 ppb, in excess of the standard of 0.7 ppb; toluene at 7.63 ppb in excess of the standard of 5 ppb;

ethylbenzene at 7.51 ppb, in excess of the standard of 5 ppb; and, total xylenes at 30.4 ppb, in excess of the standard of 5 ppb. No SVOCs were detected above standard in either groundwater sample. Samples had high turbidity and the suspended sediment may have artificially raised concentrations of volatile contaminants present.

4.0 CONCLUSIONS AND RECOMMENDATIONS

The analytical results of the soil samples collected adjacent to the hydraulic lifts located in the former auto shop at the property did not identify petroleum contamination in excess of the NYSDEC standards. Semi volatile organic compounds identified in the soil samples are indicative of fill material commonly used to raise the elevations of properties throughout New York City in the early 20th Century. No further action is recommended for the soils in this area. However, as the hydraulic lifts are out of service, AESI recommends removing both the lifts and the associated hydraulic oil tank observed at the property during the investigation.

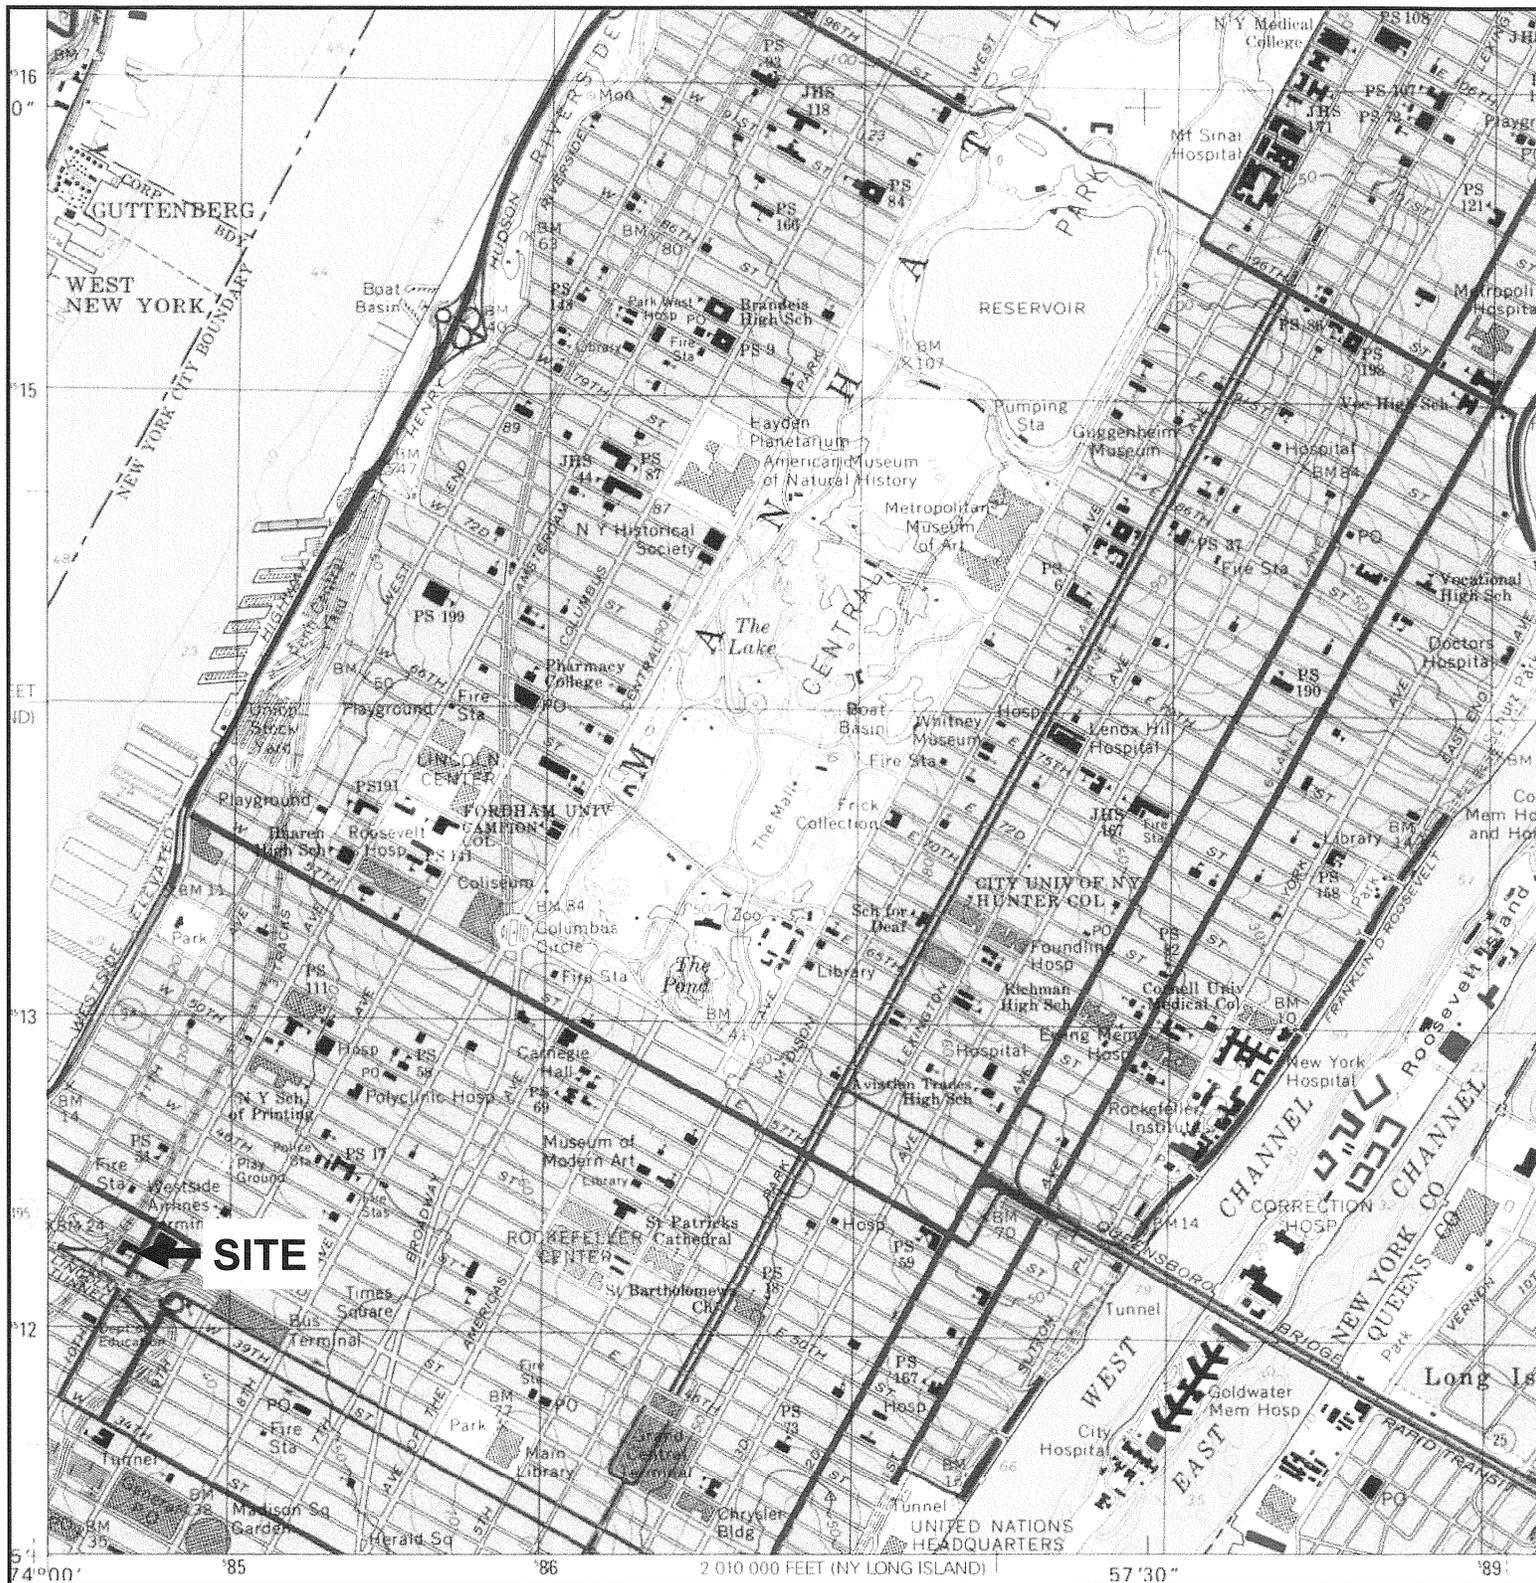

The analytical results of groundwater samples collected adjacent to the hydraulic lifts identified petroleum contamination in excess of the NYSDEC standards in both samples and acetone contamination in excess of the standard in SB-4W. Both samples had high turbidity and both temporary well points had poor water recharge during sampling. AESI recommends installing a permanent monitoring well adjacent to the former auto shop and collecting a groundwater sample to validate these results. An additional monitoring well adjacent to the southern perimeter of the former auto shop will be included in the Site Investigation Work Plan being submitted for the site.

MATRIX QUALIFIERS

- A** - Indicates the sample is an Aqueous matrix.
- O** - Indicates the sample is an Oil matrix.
- S** - Indicates the sample is a Soil, Sludge or Sediment matrix.
- X** - Indicates the sample is an Other matrix as indicated by Client Chain of Custody.

DATA QUALIFIERS

- B** - Indicates the analyte was found in the Blank and in the sample. It indicates possible sample contamination and warns the data user to use caution when applying the results of the analyte.
- C** - Common Laboratory Contaminant.
- D** - The compound was reported from the Diluted analysis.
- D.F.** - Dilution Factor.
- E** - Estimated concentration, reported results are outside the calibrated range of the instrument.
- J** - Indicates the concentration was reported below the RL but above the MDL. For GC/MS procedures, the mass spectral data meets the criteria required to identify the target compound.
- RL** - Reporting Limit.
- MDL** - Method Detection Limit.
- MI** - Indicates compound concentration could not be determined due to Matrix Interferences.
- NA** - Not Applicable.
- ND** - Indicates the compound was analyzed for but Not Detected at the MDL.

REPORT QUALIFIERS

All solid sample analyses are reported on a dry weight basis.

All solid sample values are corrected for original sample size and percent solids.

- Q** - Qualifier

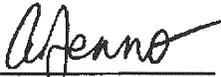

INTEGRATED ANALYTICAL LABORATORIES, LLC.

CONFORMANCE / NONCONFORMANCE SUMMARY

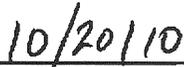

Integrated Analytical Laboratories, LLC. received four (4) aqueous and four (4) soil sample(s) from Atlantic Environmental Solutions, Inc. (Project: 547 10TH AVE.) on October 6, 2010 for the analysis of:

- (8) TAGM VO - Full List
- (7) TAGM BNA - Full List

A review of the QA/QC measures for the analysis of the sample(s) contained in this report has been performed by:

1.0 INTRODUCTION

On behalf of Solil Management, LLC, Atlantic Environmental Solutions, Inc., (AESI) prepared a Phase I Environmental Site Assessment for the property located at 547-551 10th Avenue, New York, New York at the request of the New York State Department of Environmental Conservation (NYSDEC). The Phase I report was prepared and submitted to the NYSDEC in lieu of a record search report per Appendix 3A of the Technical Guidance for Site Investigation and Remediation (DER-10).

During preparation of the Phase I, AESI identified a number of Recognized Environmental Conditions (RECs) warranting further investigation. These RECs included an open discharge case (#9503865) relating to the removal of gasoline underground storage tanks (USTs) in 1995 and two (2) in-ground hydraulic lifts inside the former auto service shop.

On September 3, 2010, the NYSDEC issued a letter requesting the following:

- 1) Submission of a Scaled Site Map
- 2) Delineation of Possible Soil Contamination in the Area of Hydraulic Lifts
- 3) Delineation of Soil and Groundwater Contamination via Installation of Monitoring Wells Around the Former Gasoline Tank Systems

The Scaled Site Map (Figure 2) and a summary investigation report (SIR) detailing the investigation of the hydraulic lifts were submitted for review by the NYSDEC in October 2009. An Investigation Work Plan (IWP) detailing the proposed investigation of the former gasoline tank system was also submitted at that time. The IWP was approved by the NYSDEC in a letter dated November 10, 2010.

2.0 SUMMARY OF INVESTIGATION ACTIVITIES

On January 3, 2011, AESI mobilized to the property to perform the soil and groundwater investigation outlined in the IWP. The aim of the investigation was to determine if soil or groundwater contamination were present within the vicinity of the former UST system at the subject property.

2.1 Soil Boring Activities

AESI advanced three (3) soil borings within the former UST system area and a fourth boring to the south of the former auto repair shop as directed by the NYSDEC. Boring locations are shown on figure 2 and soil boring logs are included as Appendix A.

Each boring was advanced to approximately 27 feet below ground surface. An organic decomposition or peat layer was identified at that depth. Due to the possibility of contamination in the shallow aquifer, and the likelihood that the peat layer was acting as a confining layer, the soil borings were not advanced any further.

Soils encountered at each boring location were field screened with a Photoionization Detector (PID) for the presence of volatile organics and both the deepest dry soil sample and the sample exhibiting the highest PID reading were submitted to a New York certified laboratory for analysis of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs).

2.2 Monitoring Well Construction

Upon the completion of split spoon sampling in each location, an auger was used to increase the diameter of the hole to facilitate monitoring well construction. Due to the presence of the peat confining layer all four (4) monitoring wells were set at a depth of approximately 25 feet below ground surface. Each boring was backfilled to 25 feet with drillers sand and then a well screen and casing was installed. Each well was constructed with 15 feet of screen and 10 feet of casing and was completed with a locking cap and flush mounted well pad. Each well was surveyed for location and elevation by a land surveyor to assist in the preparation of groundwater flow direction maps.

Each monitoring well was developed using a peristaltic pump and development water was drummed on site for future disposal.

2.3 Groundwater Sample Collection

On January 19, 2011, AESI returned to the site to collect groundwater samples from the monitoring wells. Each well was accessed, field screened, gauged and purged. Purge water was filtered through carbon to remove volatile contaminants prior to release to the site surface.

Samples were collected from each monitoring well and submitted to a New York certified laboratory for analysis of volatile organic compounds (VOCs) and semi volatile organic compounds (SVOCs).

3.0 LABORATORY ANALYTICAL RESULTS – JANUARY 2011

3.1 Soil Sample Analytical Results

A total of seven soil samples were submitted to Integrated Analytical Laboratories of Randolph, New Jersey for analysis of VOCs and SVOCs. Samples were analyzed for parameters from the rescinded Technical and Administrative Guidance Memorandum (TAGM) #4046 and results were compared to Soil Cleanup Objectives (SCO) outlined in Commissioners Policy 51 (CP-51), October 2010.

Analysis of the soil samples identified elevated concentrations of both volatile and semi volatile contaminants in the site soil. Semi-volatile contaminants identified in the site soils are consistent with historic fill material contamination and are unlikely to indicate a discharge at the site. However, volatile contaminants identified in the site soils are consistent with a gasoline discharge. Benzene was identified slightly in excess of the SCO of 0.06 parts per million (ppm)

in four (4) of the seven (7) soil samples. Ethylbenzene and total Xylenes were also identified slightly in excess of their respective standards. Please refer to Section 4 for Conclusions and Recommendations. Figure 3 shows the sample locations and the laboratory data report is included as Appendix B.

3.2 *Groundwater Sample Analytical Results*

Four (4) groundwater samples were collected at the site on January 19, 2011. These samples were delivered to Integrated Analytical Laboratories of Randolph, New Jersey for analysis of VOCs and SVOCs.

Laboratory analysis of the groundwater samples did not identify any SVOCs in excess of the groundwater standards. VOCs were identified in each of the groundwater samples. Methyl tert-butyl ether (MTBE) was identified in excess of the standard (10 parts per billion (ppb)) in MW-1, MW-2 and MW-4. Benzene was identified in excess of the standard (0.7ppb) in all four (4) monitoring wells. Ethylbenzene was identified in excess of the standard (5 ppb) in MW-2, MW-3 and MW-4. Total Xylenes were identified in excess of the standard (5 ppb) in MW-2 and MW-3. Please refer to Section 3 for Conclusions and Recommendations. Figure 2 shows the location of the monitoring wells, Figure 4 show the groundwater sample results and the laboratory data report is included as Appendix C.

4.0 **CONCLUSIONS AND RECOMMENDATIONS**

Analyses of soil samples collected within the former UST system identified petroleum contamination in excess of the most stringent NYSDEC Soil Cleanup Objective (SCO). Contamination was identified in samples collected at the water table (approximately 13 feet) and in sample collected up to 22 feet below grade. Further investigation is required to fully delineate the soil contamination. Figure 3 shows the VOC results of the soil samples.

Semi volatile organic compounds identified in the soil samples are indicative of fill material commonly used to raise the elevations of properties throughout New York City in the early 20th Century. No further action is recommended for the SVOC contamination in soils in this area.

Groundwater samples collected at the site indicate that petroleum contamination is present in excess of the groundwater standards. Figure 4 shows the concentration of compounds of concern in each monitoring well, and groundwater flow across the site from the south west (MW-4) to the north east (MW-1) is shown in Figure 5. As shown in Figure 4, the highest concentrations of benzene in the groundwater are identified in MW-1 and MW-3. The highest concentration of MTBE is identified in MW-2. MW-4, the upgradient monitoring well, shows much lower concentrations of petroleum contaminants. It is likely that the source of the petroleum contamination is located within the former UST field, between monitoring wells MW-1, MW-2 and MW-3 and that contamination in MW-4 is a result of fluctuations in groundwater flow.

AESI recommends that additional investigation be conducted to delineate the extent of the soil and groundwater contamination prior to defining a remediation strategy. A subsurface investigation should be conducted to delineate the soil and groundwater contamination across the site.

Re: *Quarterly Groundwater Monitoring Report – June 2011 Sampling Event*
547-551 10th Avenue, New York, NY
Tax Block 1069, Lots 29 and 34
NYSDEC Spill Case No. 9503865

Dear Mr. Patel:

On behalf of the property owner, Solil Management, LLC, Atlantic Environmental Solutions, Inc. (AESI) is providing this Quarterly Groundwater Monitoring Report for the property located at 547-551 10th Avenue in New York, New York (“site” or “subject property”). This report is being provided to address work requested by the New York State Department of Environmental Conservation (NYSDEC) in an April 22, 2011 letter. The NYSDEC requested that a tidal survey and quarterly groundwater monitoring be conducted at the property. Enclosed you will find the results of the June 2011 tidal survey and first quarterly groundwater monitoring event.

Please feel free to contact us at 201-876-9400 if you have any questions.

Very truly yours,

Seamus Kelly
Project Manager
CC: Solil Management

Jeffrey W. Anderson, CHMM
Vice President

1.0 INTRODUCTION

On behalf of Solil Management, LLC, Atlantic Environmental Solutions, Inc., (AESI) conducted a Summary Investigation Report for the property located at 547-551 10th Avenue, New York, New York, submitted to the New York State Department of Environmental Conservation (NYSDEC) on April 19, 2011.

On April 22, 2011 Mr. Hiralkumar Patel, the NYSDEC Case Manager for the site, issued a letter requesting that a tidal survey be performed at all monitoring wells at the site to document the effect of any tidal changes on the groundwater elevation at the site. Additionally, Mr. Patel requested quarterly groundwater monitoring for Volatile Organic Compounds (VOCs) and Semi Volatile Organic Compounds (SVOCs) in order to “*identify any trend(s) with regard to the achievement of remedial objectives.*” Specifically, the NYSDEC requires four (4) rounds of monitoring to document seasonal changes at the site and determine a site-specific groundwater flow direction.

2.0 SUMMARY OF INVESTIGATION ACTIVITIES

On June 28, 2011 and June 29, 2011, AESI mobilized to the property to perform the tidal survey and quarterly groundwater monitoring requested by the NYSDEC. The aim of the tidal survey was to determine if tidal changes had any effect of the groundwater elevation at the site.

2.1 Tidal Survey Activities

AESI installed pressure transducer data loggers in each of the four (4) monitoring wells at the property. These data loggers, which remained installed for two (2) tidal cycles over 24 hours, were used to identify elevation changes over the tidal sequence. The data loggers were installed at least 3 feet below the groundwater depth at the beginning of the sampling event to ensure they remained within the water bearing zone during the tidal cycle and the transducers were programmed to record the pressure head of water above the probe. Only three (3) of the four (4) monitoring wells located on the site were used for the tidal survey. The fourth monitoring well, MW-4, was found to contain free product, and therefore could not be included in the tidal survey.

The results of the tidal survey are included as Appendix A and a graphical representation of the data is included as Graph 1. As shown in the graph, the water level elevation did not change significantly during the survey period. In fact, the maximum elevation change was 0.2 feet and did not correspond to the tidal cycle. It is assumed that the water elevation change is associated with the traffic flow on 10th Avenue, adjacent to the site, rather than influence of the Hudson River. No further tidal investigation is recommended for this site.

2.2 *Groundwater Sample Collection*

Following the completion of the tidal survey, AESI returned to the site on June 29, 2011 to collect groundwater samples from the monitoring wells. Each well was accessed, field screened, gauged and purged. Due to the presence of free phase product in MW-4, only three (3) of the wells were sampled. A product sample was collected from MW-4 and submitted for gas chromatography (GC) fingerprinting. Please refer to Appendix B for a copy of GC fingerprint analysis results.

Samples were collected from monitoring wells MW-1, MW-2 and MW-3 and submitted to a New York certified laboratory for analysis of volatile organic compounds (VOCs) and semi volatile organic compounds (SVOCs).

Per the request of the NYSDEC in the April 22, 2011 letter, AESI will continue to conduct quarterly groundwater sampling and, upon receipt of analytical results of the sampling events, will prepare Quarterly Groundwater Monitoring Reports summarizing our findings, for submittal to the NYSDEC.

3.0 LABORATORY ANALYTICAL RESULTS – JUNE 2011

A total of three (3) groundwater samples were submitted to Integrated Analytical Laboratories of Randolph, New Jersey for analysis of VOCs and SVOCs.

Laboratory analysis of the groundwater samples identified slightly elevated concentrations of SVOCs in only one of the wells, MW-2. Benzo[a]anthracene and Chrysene were identified in excess of the standards in MW-2. However, as previously documented in the Summary Investigation Report (April 2011) historic fill contamination exists at the site, and these compounds are indicative of that. It is likely that the presence of these compounds in the groundwater is due to turbidity in the sample.

Groundwater analysis did identify VOCs each of the groundwater samples. Methyl tert-butyl ether (MTBE) was identified below the standard (10 parts per billion (ppb)) in MW-1 and MW-3, and in excess of the standard in MW-2 (56.2 ppb). Tert Butyl Alcohol was also identified in excess of the standard (50ppb) in MW-2 (132 ppb). Benzene was identified in each well in excess of the standard (0.7 ppb). Ethylbenzene was identified in excess of the standard (5 ppb) in only MW-1 (5.86 ppb) and Total Xylenes was not identified in excess of the standard (5 ppb) in any of the wells. Please refer to Section 4 for Conclusions and Recommendations. Figure 2 shows the location of the monitoring wells, Figure 3 show the groundwater sample results, Figure 4 shows the groundwater flow direction and the laboratory data report is included as Appendix C.

A sample of product identified in monitoring well MW-4 was submitted to IAL for analysis via gas chromatography. Sample results indicate that the product closely approximates #2 fuel oil and may have been degraded through weathering. Please refer to Appendix B for a copy of the laboratory results.

4.0 CONCLUSIONS AND RECOMMENDATIONS

AESI performed a tidal survey at the subject property on June 27 and June 28, 2011. No significant tidal influence was identified at the site. Minor fluctuations in the groundwater elevations were observed, however, these are likely to be associated with traffic movement on 10th Avenue, adjacent to the subject property. No further tidal investigation is recommended for this site.

Groundwater samples were collected from three (3) of the on-site monitoring wells and analyzed for VOCs and SVOC. VOC contamination in excess of the standards was identified in each of the wells. However, the concentrations of the contaminants of concern were significantly lower than the previous sample event in January 2011, with the exception of benzene in MW-2 which had increased slightly from 14.4 ppb to 15.5 ppb. Please refer to Table 1 for a summary of the groundwater sample data collected at the site to date. Low levels of two (2) historic fill SVOCs were identified in one (1) well, MW-2, but these are thought to be due to sample turbidity. AESI recommends that quarterly monitoring continue at the site to further document the downward contamination trend.

Free phase product was encountered in MW-4 during the sample event. AESI recommends that the product be removed using vacuum extraction and that the next quarterly sampling event be scheduled for after the vacuum event.

GC Fingerprint Result: June 29, 2011

ANALYTICAL DATA REPORT

for

Atlantic Environmental Solutions, Inc.

5 Marine View Plaza

Suite 303

Hoboken, NJ 07030

Project Name: 547 10TH AVE.

Lab Case Number: E11-06316

RL = REPORTING LIMIT

MDL = METHOD DETECTION LIMIT

GC-Fingerprint

Lab ID: 06316-001

Client ID: MW-4

Matrix-Units: Liquid-ug/L

Percent Moisture: 100

Date Sampled: 6/29/2011

Time Sampled: 14:10

Date Analyzed: 7/7/2011

GC FINGERPRINT ANALYSIS

Client/Project: Atlantic Environmental Solutions/547 10th AVE

Date Received: 6/29/11

Date Analyzed: 7/7/11

Lab ID	Client ID	RESULTS
06316-001	MW-4	This sample closely approximates but is not an exact match of a Fuel Oil No. 2. In many cases, petroleum products found in a site investigation have been chemically altered due to environmental exposure and the properties change. Variations in the sample as compared to the standards may be attributed to weathering. The most common forms of weathering are microbial degradation, evaporation and solubilization which can alter the composition of the material.

MATRIX QUALIFIERS

- A** - Indicates the sample is an Aqueous matrix.
- O** - Indicates the sample is an Oil matrix.
- S** - Indicates the sample is a Soil, Sludge or Sediment matrix.
- X** - Indicates the sample is an Other matrix as indicated by Client Chain of Custody.

DATA QUALIFIERS

- B** - Indicates the analyte was found in the Blank and in the sample. It indicates possible sample contamination and warns the data user to use caution when applying the results of the analyte.
- C** - Common Laboratory Contaminant.
- D** - The compound was reported from the Diluted analysis.
- D.F.** - Dilution Factor.
- E** - Estimated concentration, reported results are outside the calibrated range of the instrument.
- J** - Indicates the concentration was reported below the RL but above the MDL. For GC/MS procedures, the mass spectral data meets the criteria required to identify the target compound.
- RL** - Reporting Limit.
- MDL** - Method Detection Limit.
- MI** - Indicates compound concentration could not be determined due to Matrix Interferences.
- NA** - Not Applicable.
- ND** - Indicates the compound was analyzed for but Not Detected at the MDL.

REPORT QUALIFIERS

All solid sample analyses are reported on a dry weight basis.

All solid sample values are corrected for original sample size and percent solids.

- Q** - Qualifier

INTEGRATED ANALYTICAL LABORATORIES, LLC.

CONFORMANCE / NONCONFORMANCE SUMMARY

Integrated Analytical Laboratories, LLC. received five (5) aqueous sample(s) from Atlantic Environmental Solutions, Inc. (Project: 547 10TH AVE.) on June 29, 2011 for the analysis of:

- (5) TAGM VO - Full List + MTBE & TBA
- (4) TAGM BNA - Full List

A review of the QA/QC measures for the analysis of the sample(s) contained in this report has been performed by:

Re: Well Gauging Report
Spill # 9503865
547 10th Avenue
New York, NY

Dear Mr. Patel:

As you are aware, Atlantic Environmental Solutions, Inc. (AESI) has been involved in the investigation of groundwater contamination at the property located at 547 10th Avenue, New York, New York, on behalf of Solil Management. In June 2011 AESI performed a groundwater monitoring event at the property at the request of the New York State Department of Environmental Protection. During the monitoring event, AESI encountered floating free phase petroleum product in monitoring well MW-4. A fingerprint sample of the product was collected and submitted for analyses. Laboratory results indicate that the product closely approximates #2 fuel oil and may have been degraded through weathering.

On August 4, 2011, AESI received an email from the NYSDEC case manager, Mr. Hiralkumar Patel, requesting *“that well MW-4 must be gauged (to find out product thickness) and product must be removed by the end of 08/10/11. In addition to the quarterly groundwater monitoring-sampling of the existing wells (as per the letter dated 04/22/11), the Department also requires bi-weekly monitoring of the existing wells and recovery of free product, for next three months. Records of bi-weekly gauging/product removal must be submitted with the quarterly groundwater sampling report by the end of 10/31/11. Records of bi-weekly gauging/product removal must include but not limited to depth to water, depth to product, product thickness, dates of monitoring, method of recovery, amount recovered during the monitoring event and amount recovered to date. The Department may require additional investigation after reviewing the report.”*

On August 5, 2011, AESI requested an extension of one week to perform the product removal to allow time to gain disposal facility acceptance. On October 16, 2011, AESI mobilized to the site to gauge the monitoring wells and perform the first product removal event. The four (4) monitoring wells were accessed, field screened and gauged for depth to water and product thickness. Product was only encountered in MW-4. Approximately 0.4 feet of measurable product was present in the well.

Product removal was accomplished using vacuum extraction. The removed oil/water mixture was disposed of at Clean Water of New York, in Staten Island. A total of 362 gallons of liquid was removed from the wells and disposed of. MW-4 was gauged again following the product removal, and no measurable product was encountered. Please refer to Table 1 for the well gauging log and Appendix A for the liquid disposal manifests.

AESI returned to the site on August 30, 2011 to gauge the wells. The four (4) monitoring wells were accessed, field screened and gauged for depth to water and product thickness. Product was only encountered in MW-4. Approximately 0.5 feet of measurable product was present in the well. AESI informed the client and recommended that another removal event be conducted at the site.

On September 12, 2011, AESI returned to the site to conduct vacuum extraction of the product in MW-4. Each of the wells was gauged and product was only identified in MW-4. Approximately 0.6 feet of product was present. The vacuum event yielded a total of 2,370 gallons of oil/water mixture which was transported to Clean Water of New York, Staten Island, NY for disposal. MW-4 was gauged again following the product removal, and no measurable product was encountered. Please refer to Table 1 for the well gauging log and Appendix A for the liquid disposal manifests.

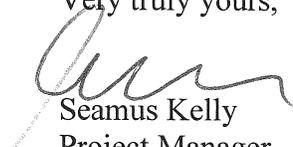

On October 11, 2011, AESI returned to the site to gauge the wells. The four (4) monitoring wells were accessed, field screened and gauged for depth to water and product thickness. Product was only encountered in MW-4. Approximately 0.3 feet of measurable product was present in the well. AESI informed the client and recommended that another removal event be conducted at the site.

On October 28, 2011, AESI returned to the site to conduct vacuum extraction of the product in MW-4. Each of the wells was gauged and product was only identified in MW-4. Approximately 0.4 feet of product was present. The vacuum event yielded a total of 942 gallons of oil/water mixture which was transported to Clean Water of New York, Staten Island, NY for disposal. MW-4 was gauged again following the product removal, and no measurable product was encountered. Please refer to Table 1 for the well gauging log. The disposal manifest for this event will be forwarded to you upon receipt from the facility.

AESI recommends that the gauging continue as a monthly event for the next quarter as the product level appears to be diminishing as a result of the vacuum extraction.

Should you have any questions regarding this report, please feel free to contact me at your convenience.

Very truly yours,

Seamus Kelly

1.0 INTRODUCTION

Enviroprobe Service, Inc. (Enviroprobe) is an environmental investigation services firm which provides monitoring well installation (HSA), Geoprobe (DPT) drilling services and Environmental & Engineering Geophysics (EEG) services to the environmental consulting and engineering community.

Enviroprobe conducted a subsurface geophysical investigation at the subject property within client-specified areas of concern. Due to conditions and objectives, the investigation utilized a Sensors and Software N250Plus cart-mounted Ground Penetrating Radar (GPR) unit with a 250 MHz antenna, a Radiodetection 4000T3 multi-frequency transmitter, a Radiodetection 4000 receiver, and a Fisher TW-6 metallic locator.

Ground penetrating radar (commonly called GPR) is a geophysical method that has been developed over the past thirty years for shallow, high-resolution, subsurface investigations of the earth. GPR uses high frequency pulsed electromagnetic waves (generally 10 MHz to 2,000 MHz) to acquire subsurface information. An EM wave is propagated downward into the ground by a transmitting antenna. Where abrupt changes in electrical properties occur in the subsurface, a portion of the energy is reflected back to the surface. This reflected wave is detected by a receiver antenna and transmitted to a control unit for real time processing and display. The penetration depth of the N250Plus unit varies from several inches to tens of feet according to site-specific conditions. The penetration depth decreases with increased soil conductivity. The penetration depth is the greatest in ice, dry sands, and fine gravels. Clayey, highly saline or saturated soils, areas covered by concrete, foundry slag, or other highly conductive materials greatly reduce GPR penetration. GPR is a method that is commonly used for environmental, engineering, archaeological, and other shallow investigations.

The Radiodetection (RD) transmitter and receiver are commonly used for pipe and cable locating. The multi-frequency transmitter can be directly connected, clamped, or used to induce a signal in a target line while the multi-frequency receiver is used to measure the signal from energized lines.

The Fisher TW-6 metallic locator is designed to find pipes, cables and other metallic objects such as underground storage tanks (USTs). The TW-6 transmitter generates an electromagnetic field that induces electrical currents in the subsurface. These currents produce a secondary electromagnetic field that is measured by the TW-6 receiver. One surveyor can carry both the transmitter and receiver together to search for underground metallic objects, although the TW-6 response can also be affected by the electrical properties of non-metallic materials in the subsurface.

2.0 SCOPE OF WORK

On December 14, 2011, a geophysicist from Enviroprobe Service Inc. was mobilized to the subject property to perform a geophysical investigation. The purpose of this investigation was to detect possible USTs and designate underground conduits/utilities within client-specified portions of the subject property. The survey included interior and exterior areas at a former service station. The ground surface of the survey area consisted of paved, gravel, and broken concrete surfaces.

3.0 SURVEY RESULTS

The survey was conducted using a cart-mounted GPR unit, a Fisher TW-6 metallic locator, and a RD unit. The GPR and TW-6 were used in a grid pattern over all client-specified areas of the property. Based on the results of the GPR and TW-6 surveys, two metallic anomalies and four non-metallic anomalies were identified. None of these anomalies were considered consistent with an UST. One of the non-metallic anomalies was consistent with prior excavation. A nearby vent pipe was also designated running towards this anomaly [Figure 1]. GPR signals in the area of another non-metallic anomaly were considered consistent with a buried concrete pad or vault cover [Figure 2]. The RD unit was used to trace common utilities from sources in and around the survey area. Designated utilities were marked on-site with pink spray paint.

4.0 LIMITATIONS

The client-selected areas of the property contained obstructions including miscellaneous debris and hydraulic lifts. These objects prevented a thorough investigation of the spaces beneath and immediately adjacent to them.

Due to surface conditions and subsurface content, the GPR signal penetration was estimated at 3 feet in the majority of the survey area. This penetration was reduced to less than 2 feet in areas of concrete cover.

The TW-6 survey was kept up to 6 feet away from aboveground objects containing metals depending on the sizes, shapes and positions of the metal objects. The TW-6 survey was not effective in areas with reinforced concrete.

Due to the dielectric properties of the subsurface, plastic polymer and fiberglass utilities may not have been detected.

All field services were conducted in compliance with the industry standard of care guidelines found in ASCE 38-02 (Level B).

5.0 WARRANTIES

The field observations and measurements reported herein are considered sufficient in detail and scope for this project. Enviroprobe Service, Inc. warrants that the findings and conclusions contained herein have been promulgated in accordance with generally accepted environmental engineering methods. There is a possibility that conditions may exist which could not be identified within the scope of this project and were not apparent during the site activities performed for this project.

Enviroprobe represents that the services were performed in a manner consistent with that level of care and skill ordinarily exercised by environmental consultants under similar circumstances. No other representations to Client, express or implied, and no warranty or guarantee is included or intended in this agreement, or in any report, document, or otherwise.

Enviroprobe Service, Inc. believes that the information provided in this report is reliable. However, Enviroprobe cannot warrant or guarantee that the information provided by others is complete or accurate. No other warranties or guarantees are implied or expressed.

GPR data is subject to signal anomalies and operator interpretation. The GPR data is intended to provide the locations of areas of concern requiring additional investigation or the approximate location of underground structures and utilities. Great care must be utilized when excavating and/or drilling around underground structures and utilities since GPR data can only be used for estimation purposes and GPR data is subject to misinterpretation. Enviroprobe can not guarantee that utilities, post-tension cables, and/or rebar will not be incurred during drilling, cutting, coring, or excavating activities.

This report was prepared pursuant to the contract Enviroprobe has with the Client. That contractual relationship included an exchange of information about the property that was unique and between Enviroprobe and its client and serves as the basis upon which this report was prepared. Because of the importance of the communication between Enviroprobe and its client, reliance or any use of this report by anyone other than the Client, for whom it was prepared, is prohibited and therefore not foreseeable to Enviroprobe.

Reliance or use by any such third party without explicit authorization in the report does not make said third party a third party beneficiary to Enviroprobe contract with the Client. Any such unauthorized reliance on or use of this report, including any of its information or conclusions, will be at the third party's risk. For the same reasons, no warranties or representations, expressed or implied in this report, are made to any such third party.

Figure 1 – Non-metallic anomaly consistent with a prior excavation designated with pink paint. A nearby vent line is also designated with pink arrows.

Figure 2 – Non-metallic anomaly consistent with buried concrete pad designated in pink.

Lab Number: L1121055
Report Date: 12/29/11

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

Total Petroleum Hydrocarbons (TPH) by GC/FID

Sample PRODUCT A - TOP OF JAR (L1121055-01) contains hydrocarbons eluting in the range of n-Octane (C8) to just after the elution of n-Tetracontane (C40). The chromatogram is indicating a mixture of two petroleum products.

Based on the data generated sample PRODUCT A - TOP OF JAR (L1121055-01) consists of material eluting in the early molecular weight range of the chromatogram. The material present is a discrete pattern of resolved peaks eluting between n- n-Octane (C8) and n-Hexadecane (C16). This pattern appears to be gasoline. The gasoline appears to be weathered based on the chromatography. In addition, material eluting from n-Hexadecane (C16) and after n-Tetracontane (C40) contains an unresolved complex mixture (UCM) eluting in the heavy molecular weight range of the chromatogram. The absence of resolved peaks in the heavy molecular

Lab Number: L1121055
Report Date: 12/29/11

Case Narrative (continued)

weight range in which the unresolved complex mixture (UCM) elutes indicates that the sample is a refined petroleum product similar to lubricating oil/motor oil/waste oil type product.

Sample PRODUCT B - BOTTOM OF JAR (L1121055-02) was determined to be water based and contains peaks eluting in the early molecular weight range of the chromatogram. These peaks are eluting in the range between n-Octane (C8) and n-Heneicosane (C21). These peaks do not match any reference material and cannot be identified by this method. In addition, there is material eluting from n-Hexadecane (C16) and after n-Tetracontane (C40) which contains an unresolved complex mixture (UCM) eluting in the heavy molecular weight range of the chromatogram. The absence of resolved peaks in the heavy molecular weight range in which the unresolved complex mixture (UCM) elutes indicates that the sample is a refined petroleum product similar to lubricating oil/motor oil/waste oil type product. It is possible that this heavier weight material is a result of the overlying TOP product and some fraction is dissolved into the BOTTOM water-based material.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

Report Format: Data Usability Report

Project Name: EXTELL
Project Number: 11454-0002

Lab Number: L1121055
Report Date: 12/29/11

Data Qualifiers

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certificate/Approval Program Summary

Last revised December 9, 2011 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

Connecticut Department of Public Health Certificate/Lab ID: PH-0141.

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

Air & Emissions (EPA TO-15.)

New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: EPA 245.7, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081B, 8082A, 8260B, 8270C, 8015D.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 3060A, 6020A, 7471A, 9040B, 9045C, 7196A. Organic Parameters: SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 5035, 8260B, 8270C, 8015D, 8082A, 8081B.)

New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: SW-846 1312, 3010, 3020A, SM2320B, SM2540D, 2540G, EPA 180.1, 1631E, SW-846 7470A, 9040B, 6020, 9050A. Organic Parameters: SW-846 3510C, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8015B 8081A, 8082, 8260B, 8270C)

Solid & Chemical Materials (Inorganic Parameters: SW-846 6020, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 7474, 9040B, 9045C, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 8015B.)

Atmospheric Organic Parameters (EPA TO-15)

Biological Tissue (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610C, 3630C, 3640A)

New York Department of Health Certificate/Lab ID: 11627. **NELAP Accredited.**

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 245.7, 7470A, 9014, 9040B, 9050, 120.1, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 3020A. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

Air & Emissions (EPA TO-15.)

Pennsylvania Certificate/Lab ID: 68-02089 **NELAP Accredited**

Solid & Hazardous Waste (Inorganic Parameters: EPA 6020A, 7471B, 7474. Organic Parameters: EPA 3050B, 3540C, 3630C, 8270C, 8081B, 8082A.)

Rhode Island Department of Health Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to LA-DEQ Certificate for Non-Potable Water.

Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

Solid & Chemical Materials (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

Air (Organic Parameters: EPA TO-15)

Washington State Department of Ecology Certificate/Lab ID: C954. *Non-Potable Water* (Inorganic Parameters: SM2540D, 180.1, 1631E.)

Solid & Chemical Materials (Inorganic Parameters: EPA 6020, 7470, 7471, 7474, 9045C, 9050A, 9060. Organic Parameters: EPA 8081, 8082, 8015 Mod, 8270.)

U.S. Army Corps of Engineers

Department of Defense Certificate/Lab ID: L2217.01.

Non-Potable Water (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 5030B, 8260B, 8270C, 8270C-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 1311, 1312, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 5035A, 8260B, 8270C, 8270-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

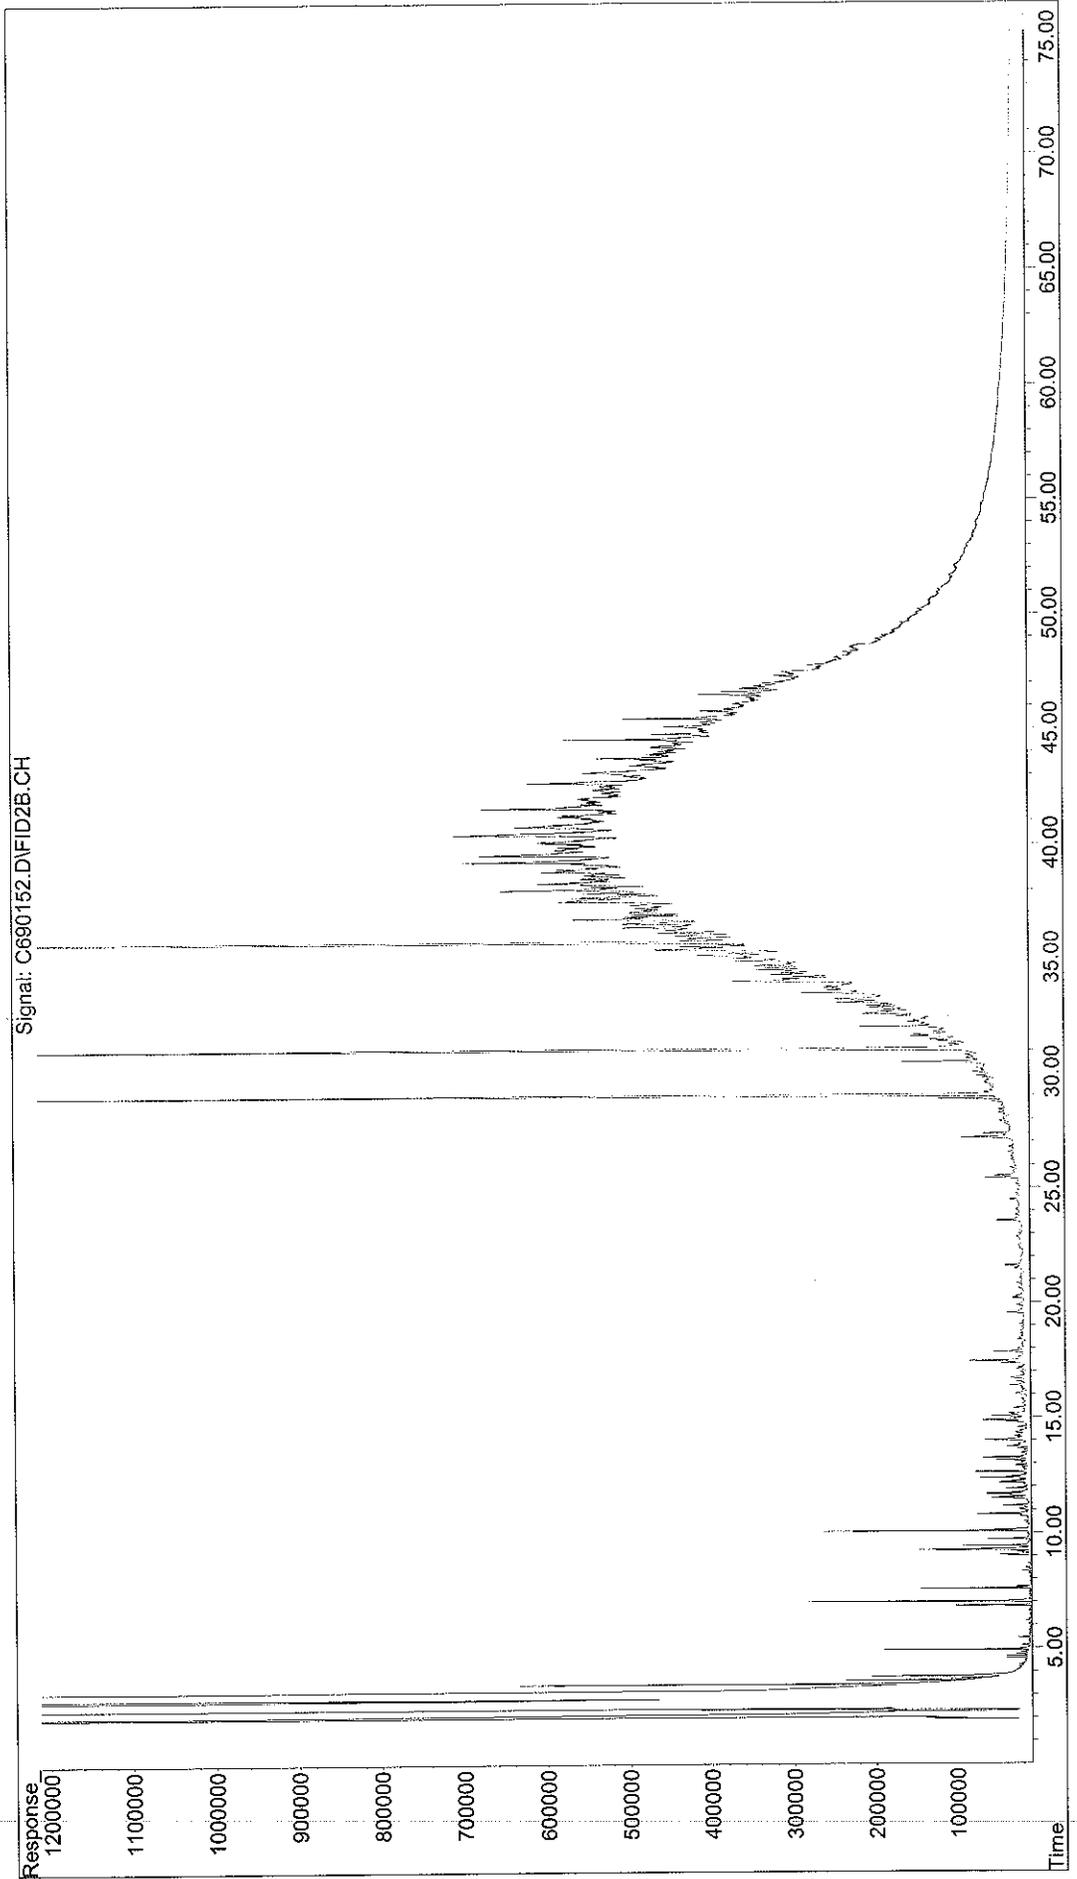

Air & Emissions (EPA TO-15.)

Analytes Not Accredited by NELAP

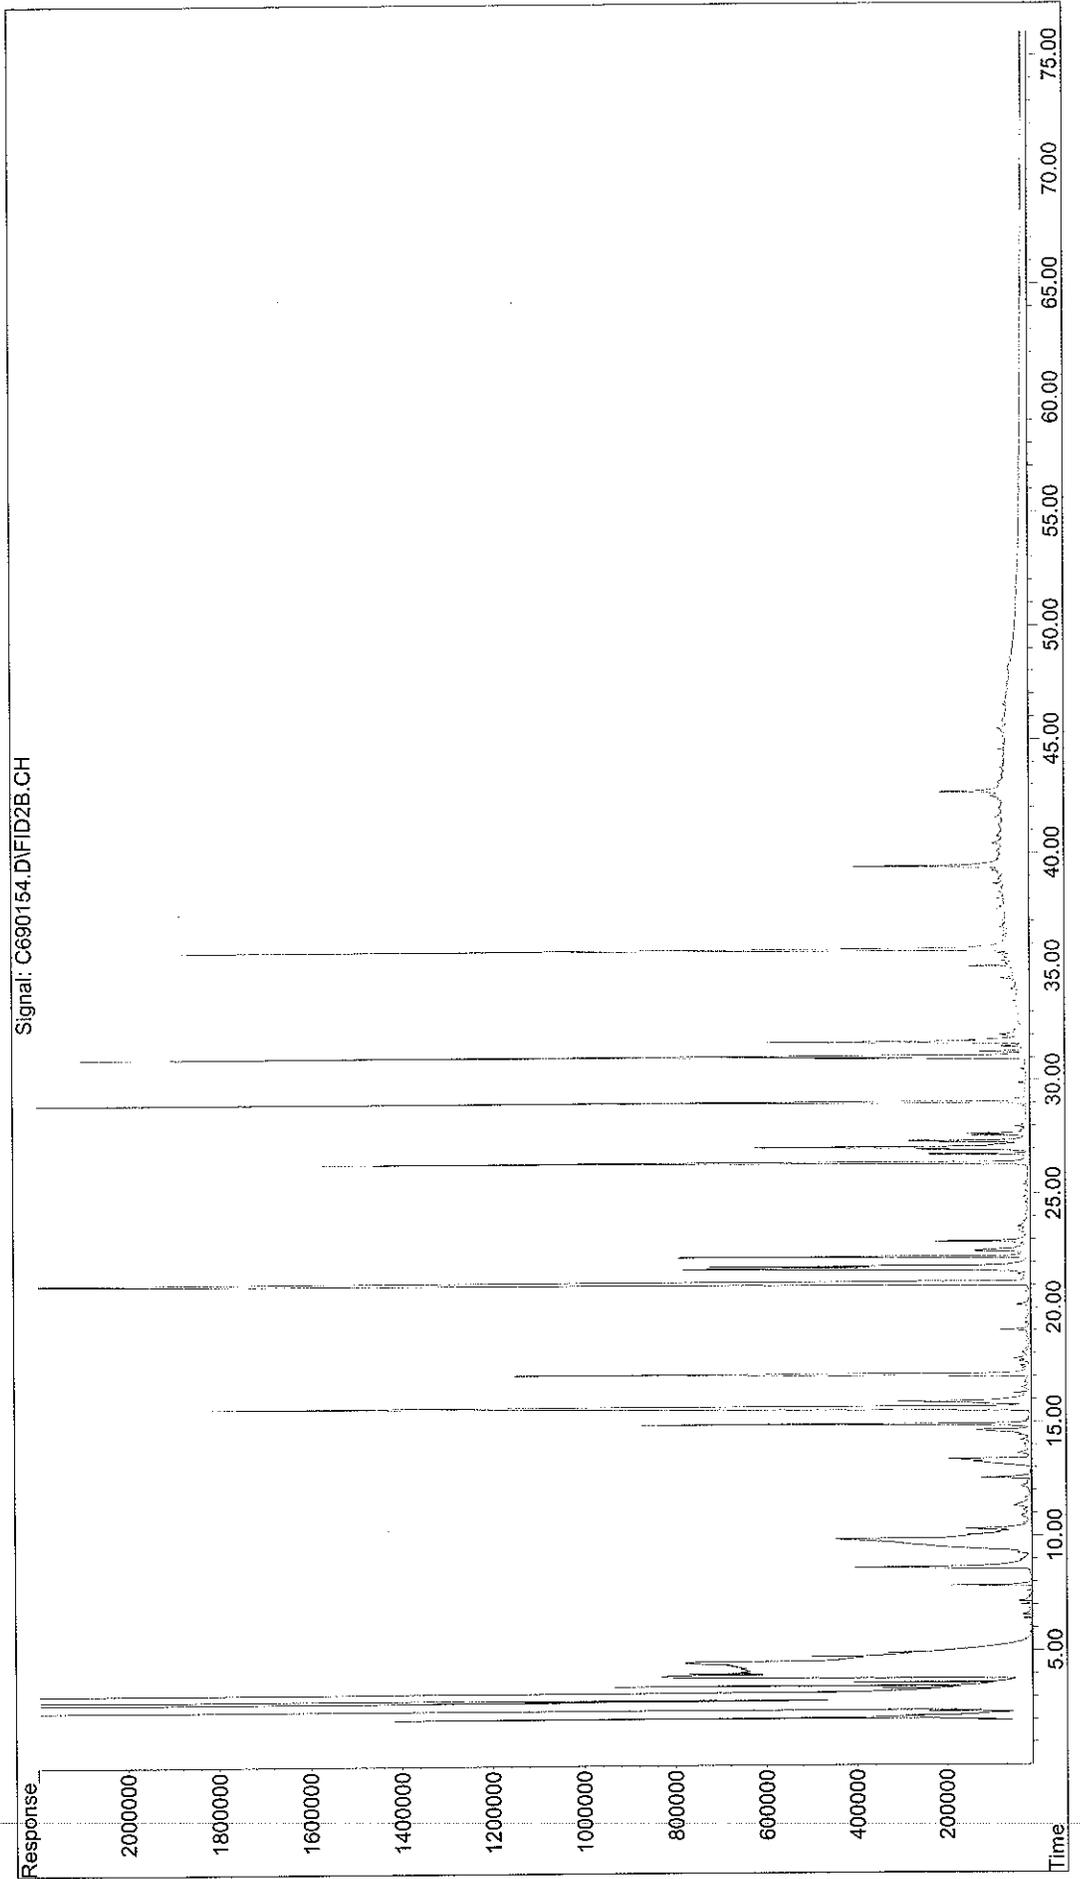

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl. **TO-15**: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.

Lab Number: L1121840
Report Date: 01/09/12

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

L1121840-10, -16, -20, -21, -29, and -32 have elevated detection limits due to the dilutions required by the elevated concentrations of target compounds in the samples.

L1121840-18 and -23 have elevated detection limits due to the dilutions required by the elevated concentrations of non-target compounds in the samples.

Semivolatile Organics

L1121840-01, -07, -11, -12, -15, -16, -18, and -19 have elevated detection limits due to the dilutions

Project Name: EXTELL
Project Number: 11454-0002

Lab Number: L1121840
Report Date: 01/09/12

Case Narrative (continued)

required by the sample matrix (extracts were dark and viscous).

L1121840-09 and -20 have elevated detection limits due to the dilutions required by the elevated concentrations of target compounds in the samples.

L1121840-09 and -20 were re-analyzed on dilution in order to quantitate the samples within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial analysis. The re-analysis was performed only for the compound that exceeded the calibration range.

L1121840-13 has elevated detection limits due to the dilution required by the sample matrix (extract was dark and viscous) and the dilution required by matrix interferences encountered during the concentration of the sample.

The surrogate recoveries for L1121840-13 are below the acceptance criteria for 2-Fluorophenol, Phenol-d6, Nitrobenzene-d5, 2-Fluorobiphenyl, and 4-Terphenyl-d14 (all 0%) due to the dilutions required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

The surrogate recoveries for L1121840-17 and -23 are outside the individual acceptance criteria for 2-Fluorobiphenyl (29% and 121%, respectively), but within the overall method allowances.

The WG512537-2/-3 LCS/LCSD recoveries, associated with L1121840-02, were above the acceptance criteria for 2,4-Dinitrotoluene (90%/95%); however, the associated sample was non-detect for this target compound. The results of the original analysis are reported.

Semivolatile Organics by SIM

L1121840-29 was re-analyzed on dilution in order to quantitate the sample within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial analysis. The re-analysis was performed only for the compound that exceeded the calibration range.

PCBs

The surrogate recovery for L1121840-17 is below the individual acceptance criteria for Decachlorobiphenyl (27%), but within the overall method allowances.

Project Name: EXTCELL
Project Number: 11454-0002

Lab Number: L1121840
Report Date: 01/09/12

Case Narrative (continued)

Pesticides

L1121840-01, -03, -07, -09, -11, and -16 have elevated detection limits due to the dilutions required by the sample matrix (extracts were dark yellow).

L1121840-05 was re-analyzed on dilution in order to quantitate the sample within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial analysis. The re-analysis was performed only for the compound that exceeded the calibration range.

L1121840-13 has elevated detection limits due to the dilution required by the sample matrix (extract was brown).

The surrogate recoveries for L1121840-09 and -13 are below the acceptance criteria for 2,4,5,6-Tetrachloro-m-xylene and Decachlorobiphenyl (all 0%) due to the dilutions required to quantitate the samples. Re-extraction was not required; therefore, the results of the original analyses are reported.

The surrogate recovery for L1121840-10 and -14 is above the individual acceptance criteria for 2,4,5,6-Tetrachloro-m-xylene (304% and 2010% respectively), but within the overall method allowances.

The surrogate recovery for L1121840-11 and -16 is above the individual acceptance criteria for Decachlorobiphenyl (186% and 152% respectively), but within the overall method allowances.

The dual column RPD for L1121840-35 is above the acceptance criteria for Endosulfan I; however, no obvious column interferences are present. The higher of the two results is reported and qualified with a "P".

The WG511446-2/-3 LCS/LCSD RPDs, associated with L1121840-01 through -18, are above the acceptance criteria for Delta-BHC (31%) and Methoxychlor (33%).

Total Metals

L1121840-01, -07, -09, and -13 have elevated detection limits for all elements, with the exception of Mercury and Calcium, due to the dilutions required by the sample matrix.

L1121840-01, -07, -09, and -13 have elevated detection limits for Calcium due to the dilution required to quantitate the results within the calibration range.

L1121840-02, -03, -04, -06, -08, -10, -11, -12, and -14 through -18 have elevated detection limits for all elements, with the exception of Mercury, due to the dilutions required by the sample matrix.

Project Name: EXTCELL
Project Number: 11454-0002

Lab Number: L1121840
Report Date: 01/09/12

Case Narrative (continued)

L1121840-05 has elevated detection limits for all elements, with the exception of Calcium, Mercury and Zinc, due to the dilutions required by the sample matrix.

L1121840-05 has elevated detection limits for Calcium and Zinc due to the dilutions required to quantitate the results within the calibration range.

L1121840-24 through -29 and -32 through -35 have elevated detection limits for Antimony, Beryllium, and Thallium due to the dilutions required by the high concentrations of non-target analytes.

The WG511631-4 MS recovery, performed on L1121840-12, is above the acceptance criteria for Mercury (3670%). A post digestion spike was performed with an acceptable recovery of 102%.

The WG511655-4 MS recoveries, performed on L1121840-24, are above the acceptance criteria for Aluminum (185%) and Chromium (130%). A post digestion spike was performed with acceptable recoveries for Aluminum (80%) and Chromium (85%).

The WG511655-4 MS recoveries for Calcium (0%), Iron (800%), Manganese (188%), performed on L1121840-24, do not apply because the sample concentrations are greater than four times the spike amount added.

The WG511828-4 MS recoveries for Aluminum (168%), Calcium (0%), Iron (0%), Magnesium (0%), and Nickel (0%) performed on L1121840-01, do not apply because the sample concentrations are greater than four times the spike amount added.

The WG511828-4 MS recoveries, performed on L1121840-01, are below the acceptance criteria for Antimony (31%), Copper (71%), Potassium (67%), and Zinc (22%). A post digestion spike was performed with acceptable recoveries for Antimony (91%), Copper (90%), Potassium (107%) and Zinc (79%).

The WG512513-4 MS recovery, performed on L1121840-27, is above the acceptance criteria for Mercury (137%). A post digestion spike was performed with an acceptable recovery of 107%.

The WG511655-3 Laboratory Duplicate RPD, performed on L1121840-24, is outside the acceptance criteria for Copper (30%). The elevated RPD has been attributed to the non-homogeneous nature of the sample utilized for the Laboratory Duplicate.

The WG511828-3 Laboratory Duplicate RPD, performed on L1121840-01, is outside the acceptance criteria for Zinc (42%). The elevated RPD has been attributed to the non-homogeneous nature of the sample utilized for the Laboratory Duplicate.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
C	- Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
D	- Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
E	- Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
G	- The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
H	- The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
I	- The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
M	- Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
NJ	- Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

Report Format: DU Report with "J" Qualifiers

Project Name: EXTELL
Project Number: 11454-0002

Lab Number: L1121840
Report Date: 01/09/12

Data Qualifiers

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL). This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certificate/Approval Program Summary

Last revised January 3, 2012 - Westboro Facility

The following list includes only those analytes/methods for which certification/approval is currently held.
For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

Connecticut Department of Public Health Certificate/Lab ID: PH-0574. **NELAP Accredited Solid Waste/Soil.**

Drinking Water (Inorganic Parameters: Color, pH, Turbidity, Conductivity, Alkalinity, Chloride, Free Residual Chlorine, Fluoride, Calcium Hardness, Sulfate, Nitrate, Nitrite, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Dissolved Solids, Total Organic Carbon, Total Cyanide, Perchlorate. Organic Parameters: Volatile Organics 524.2, Total Trihalomethanes 524.2, 1,2-Dibromo-3-chloropropane (DBCP), Ethylene Dibromide (EDB), 1,4-Dioxane (Mod 8270). Microbiology Parameters: Total Coliform-MF mEndo (SM9222B), Total Coliform – Colilert (SM9223 P/A), E. Coli. – Colilert (SM9223 P/A), HPC – Pour Plate (SM9215B), Fecal Coliform – MF m-FC (SM9222D))

Wastewater/Non-Potable Water (Inorganic Parameters: Color, pH, Conductivity, Acidity, Alkalinity, Chloride, Total Residual Chlorine, Fluoride, Total Hardness, Silica, Sulfate, Sulfide, Ammonia, Kjeldahl Nitrogen, Nitrate, Nitrite, O-Phosphate, Total Phosphorus, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Dissolved Solids, Total Suspended Solids (non-filterable), BOD, CBOD, COD, TOC, Total Cyanide, Phenolics, Foaming Agents (MBAS), Bromide, Oil and Grease. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, 2,4-D, 2,4,5-T, 2,4,5-TP(Silvex), Acid Extractables (Phenols), Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, Polynuclear Aromatic Hydrocarbons, Haloethers, Chlorinated Hydrocarbons, Volatile Organics, TPH (HEM/SGT), Extractable Petroleum Hydrocarbons (ETPH), MA-EPH, MA-VPH. Microbiology Parameters: Total Coliform – MF mEndo (SM9222B), Total Coliform – MTF (SM9221B), HPC – Pour Plate (SM9215B), Fecal Coliform – MF m-FC (SM9222D), Fecal Coliform – A-1 Broth (SM9221E).)

Solid Waste/Soil (Inorganic Parameters: pH, Sulfide, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Tin, Vanadium, Zinc, Total Cyanide, Ignitability, Phenolics, Corrosivity, TCLP Leach (1311), SPLP Leach (1312 metals only), Reactivity. Organic Parameters: PCBs, PCBs in Oil, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Extractable Petroleum Hydrocarbons (ETPH), MA-EPH, MA-VPH, Dicamba, 2,4-D, 2,4,5-T, 2,4,5-TP(Silvex), Volatile Organics, Acid Extractables (Phenols), 3,3'-Dichlorobenzidine, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

Maine Department of Human Services Certificate/Lab ID: 2009024.

Drinking Water (Inorganic Parameters: SM9215B, 9222D, 9223B, EPA 180.1, 353.2, SM2130B, 2320B, 2540C, 4500CI-D, 4500CN-C, 4500CN-E, 4500F-C, 4500H+B, 4500NO3-F, EPA 200.7, EPA 200.8, 245.1, EPA 300.0. Organic Parameters: 504.1, 524.2.)

Wastewater/Non-Potable Water (Inorganic Parameters: EPA 120.1, 1664A, 350.1, 351.1, 353.2, 410.4, 420.1, SM2320B, 2510B, 2540C, 2540D, 426C, 4500CI-D, 4500CI-E, 4500CN-C, 4500CN-E, 4500F-B, 4500F-C, 4500H+B, 4500Norg-B, 4500Norg-C, 4500NH3-B, 4500NH3-G, 4500NH3-H, 4500NO3-F, 4500P-B, 4500P-E, 5210B, 5220D, 5310C, 9010B, 9040B, 9030B, 7470A, 7196A, 2340B, EPA 200.7, 6010, 200.8, 6020, 245.1, 1311, 1312, 3005A, Enterolert, 9223D, 9222D. Organic Parameters: 608, 8081, 8082, 8330, 8151A, 624, 8260, 3510C, 3630C, 5030B, ME-DRO, ME-GRO, MA-EPH, MA-VPH.)

Solid Waste/Soil (Inorganic Parameters: 9010B, 9012A, 9014A, 9040B, 9045C, 6010B, 7471A, 7196A, 9050A, 1010, 1030, 9065, 1311, 1312, 3005A, 3050B. Organic Parameters: ME-DRO, ME-GRO, MA-EPH, MA-VPH, 8260B, 8270C, 8330, 8151A, 8081A, 8082, 3540C, 3546, 3580A, 3630C, 5030B, 5035.)

Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA086.

Drinking Water (Inorganic Parameters: (EPA 200.8 for: Sb,As,Ba,Be,Cd,Cr,Cu,Pb,Ni,Se,Tl) (EPA 200.7 for: Ba,Be,Ca,Cd,Cr,Cu,Na,Ni) 245.1, (300.0 for: Nitrate-N, Fluoride, Sulfate); (EPA 353.2 for: Nitrate-N, Nitrite-N); (SM4500NO3-F for: Nitrate-N and Nitrite-N); 4500F-C, 4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, 2320B, SM2540C, SM4500H-B. Organic Parameters: (EPA 524.2 for: Trihalomethanes, Volatile Organics); (504.1 for: 1,2-Dibromoethane, 1,2-Dibromo-3-Chloropropane), EPA 332. Microbiology Parameters: SM9215B; ENZ. SUB. SM9223; ColilertQT SM9223B; MF-SM9222D.)

SM2510B, 2540C, 2340B, 2320B, 4500CL-E, 4500F-BC, 426C, SM4500NH3-BH, (EPA 350.1 for: Ammonia-N), LACHAT 10-107-06-1-B for Ammonia-N, SM4500NO3-F, 353.2 for Nitrate-N, SM4500NH3-BC-NES, EPA 351.1, SM4500P-E, 4500P-B,E, 5220D, EPA 410.4, SM 5210B, 5310C, 4500CL-D, EPA 1664, SM14 510AC, EPA 420.1, SM4500-CN-CE, SM2540D.

Organic Parameters: (EPA 624 for Volatile Halocarbons, Volatile Aromatics),(608 for: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs-Water), (EPA 625 for SVOC Acid Extractables and SVOC Base/Neutral Extractables), 600/4-81-045-PCB-Oil. Microbiology Parameters: (ColilertQT SM9223B;Enterolert-QT: SM9222D-MF.)

New Hampshire Department of Environmental Services Certificate/Lab ID: 200307. *NELAP Accredited.*

Drinking Water (Inorganic Parameters: SM 9222B, 9223B, 9215B, EPA 200.7, 200.8, 245.2, 300.0, SM4500CN-E, 4500H+B, 4500NO3-F, 2320B, 2510B, 2540C, 4500F-C, 5310C, 2120B, EPA 332.0. Organic Parameters: 504.1, 524.2.)

Non-Potable Water (Inorganic Parameters: SM9222D, 9221B, 9222B, 9221E-EC, EPA 3005A, 200.7, 200.8, 245.1, 245.2, SW-846 6010B, 6020, 7196A, 7470A, SM3500-CR-D, EPA 120.1, 300.0, 350.1, 350.2, 351.1, 353.2, 410.4, 420.1, 1664A, SW-846 9010, 9030, 9040B, SM426C, SM2120B, 2310B, 2320B, 2540B, 2540D, 4500H+B, 4500CL-E, 4500CN-E, 4500NH3-H, 4500NO3-F, 4500NO2-B, 4500P-E, 4500-S2-D, 5210B, 5220D, 2510B, 2540C, 4500F-C, 5310C, 5540C, LACHAT 10-204-00-1-A, LACHAT 10-107-06-2-D. Organic Parameters: SW-846 3510C, 3630C, 5030B, 8260B, 8270C, 8330, EPA 624, 625, 608, SW-846 8082, 8081A, 8151A.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 6010B, 7196A, 7471A, 1010, 1030, 9010, 9012A, 9014, 9030B, 9040B, 9045C, 9050C, 9065,1311, 1312, 3005A, 3050B. Organic Parameters: SW-846 3540C, 3546, 3550B, 3580A, 3630C, 5030B, 5035, 8260B, 8270C, 8330, 8151A, 8015B, 8082, 8081A.)

New Jersey Department of Environmental Protection Certificate/Lab ID: MA935. *NELAP Accredited.*

Drinking Water (Inorganic Parameters: SM9222B, 9221E, 9223B, 9215B, 4500CN-CE, 4500NO3-F, 4500F-C, EPA 300.0, 200.7, 200.8, 245.2, 2540C, SM2120B, 2320B, 2510B, 5310C, SM4500H-B. Organic Parameters: EPA 332, 504.1, 524.2.)

Non-Potable Water (Inorganic Parameters: SM5210B, EPA 410.4, SM5220D, 4500CI-E, EPA 300.0, SM2120B, SM4500F-BC, EPA 200.7, 351.1, LACHAT 10-107-06-2-D, EPA 353.2, SM4500NO3-F, 4500NO2-B, EPA 1664A, SM5310B, C or D, 4500-PE, EPA 420.1, SM510ABC, SM4500P-B5+E, 2540B, 2540C, 2540D, EPA 120.1, SM2510B, SM15 426C, 9222D, 9221B, 9221C, 9221E, 9222B, 9215B, 2310B, 2320B, 4500NH3-H, 4500-S D, EPA 350.1, 350.2, SW-846 1312, 6020, 6020A, 7470A, 5540C, 4500H-B, EPA 200.8, SM3500Cr-D, 4500CN-CE, EPA 245.1, 245.2, SW-846 9040B, 3005A, 3015, EPA 6010B, 6010C, 7196A, 3060A, SW-846 9010B, 9030B. Organic Parameters: SW-846 8260B, 8270C, 8270D, 8270C-SIM, 8270D-SIM, 3510C, EPA 608, 624, 625, SW-846 3630C, 5030B, 8081A, 8081B, 8082, 8082A, 8151A, 8330, NJ OQA-QAM-025 Rev.7, NJ EPH.)

Solid & Chemical Materials (Inorganic Parameters: SW-846, 6010B, 6010C, 7196A, 3060A, 9010B, 9030B, 1010, 1030, 1311, 1312, 3005A, 3050B, 7471A, 7471B, 9014, 9012A, 9040B, 9045C, 9050A, 9065. Organic Parameters: SW-846 8015B, 8015C, 8081A, 8081B, 8082, 8082A, 8151A, 8330, 8260B, 8270C, 8270D, 8270C-SIM, 8270D-SIM, 3540C, 3545, 3546, 3550B, 3580A, 3630C, 5030B, 5035L, 5035H, NJ OQA-QAM-025 Rev.7, NJ EPH.)

New York Department of Health Certificate/Lab ID: 11148. *NELAP Accredited.*

Drinking Water (Inorganic Parameters: SM9223B, 9222B, 9215B, EPA 200.8, 200.7, 245.2, SM5310C, EPA 332.0, SM2320B, EPA 300.0, SM2120B, 4500CN-E, 4500F-C, 4500H-B, 4500NO3-F, 2540C, SM 2510B. Organic Parameters: EPA 524.2, 504.1.)

Non-Potable Water (Inorganic Parameters: SM9221E, 9222D, 9221B, 9222B, 9215B, 5210B, 5310C, EPA 410.4, SM5220D, 2310B-4a, 2320B, EPA 200.7, 300.0, SM4500CL-E, 4500F-C, SM15 426C, EPA 350.1, SM4500NH3-BH, EPA 351.1, LACHAT 10-107-06-2, EPA 353.2, LACHAT 10-107-04-1-C, SM4500-NO3-F, 4500-NO2-B, 4500P-E, 2540C, 2540B, 2540D, EPA 200.8, EPA 6010B, 6020, EPA 7196A, SM3500Cr-D, EPA 245.1, 245.2, 7470A, SM2120B, LACHAT 10-204-00-1-A, EPA 9040B, SM4500-HB, EPA 1664A, EPA 420.1, SM14 510C, EPA 120.1, SM2510B, SM4500S-D, SM5540C, EPA 3005A, 9010B, 9030B.. Organic Parameters: EPA 624, 8260B, 8270C, 625, 608, 8081A, 8151A, 8330, 8082, EPA 3510C, 5030B.)

Solid & Hazardous Waste (Inorganic Parameters: 1010, 1030, EPA 6010B, 7196A, 7471A, 9012A, 9014, 9040B, 9045C, 9065, 9050, EPA 1311, 1312, 3005A, 3050B, 9010B, 9030B. Organic Parameters: EPA 8260B, 8270C, 8015B, 8081A, 8151A, 8330, 8082, 3540C, 3545, 3546, 3580, 5030B, 5035.)

North Carolina Department of the Environment and Natural Resources Certificate/Lab ID : 666. Organic Parameters: MA-EPH, MA-VPH.

Pennsylvania Department of Environmental Protection Certificate/Lab ID : 68-03671. **NELAP Accredited.**
Drinking Water (Organic Parameters: EPA 524.2, 504.1)

Non-Potable Water (Inorganic Parameters: EPA 1312, 200.7, 410.4, 1664A, SM2540D, 5210B, 5220D, 4500-P,BE.
Organic Parameters: EPA 3510C, 3005A, 3630C, 5030B, 625, 624, 608, 8081A, 8081B, 8082, 802A, 8151A, 8260B, 8270C, 8270D, 8330)

Solid & Hazardous Waste (Inorganic Parameters: EPA 350.1, 1010, 1030, 1311, 1312, 3050B, 3060A, 6010B, 6010C, 7196A, 7471A, 9010B, 9012A, 9014, 9040B, 9045C, 9050, 9065, SM 4500NH3-H. Organic Parameters: 3540C, 3546, 3580A, 3630C, 5035, 8015B, 8015C, 8081A, 8081B, 8082, 8082A, 8151A, 8260B, 8270C, 8270D, 8330)

Rhode Island Department of Health Certificate/Lab ID: LAO00065. **NELAP Accredited via NY-DOH.**
 Refer to MA-DEP Certificate for Potable and Non-Potable Water.
 Refer to NJ-DEP Certificate for Potable and Non-Potable Water.

Texas Commission on Environmental Quality Certificate/Lab ID: T104704476-09-1. **NELAP Accredited.**

Non-Potable Water (Inorganic Parameters: EPA 120.1, 1664, 200.7, 200.8, 245.1, 245.2, 300.0, 350.1, 351.1, 353.2, 410.4, 420.1, 6010, 6020, 7196, 7470, 9040, SM 2120B, 2310B, 2320B, 2510B, 2540B, 2540C, 2540D, 426C, 4500CL-E, 4500CN-E, 4500F-C, 4500H+B, 4500NH3-H, 4500NO2B, 4500P-E, 4500 S²⁻ D, 510C, 5210B, 5220D, 5310C, 5540C. Organic Parameters: EPA 608, 624, 625, 8081, 8082, 8151, 8260, 8270, 8330.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 1311, 1312, 9012, 9014, 9040, 9045, 9050, 9065.)

Virginia Division of Consolidated Laboratory Services Certificate/Lab ID: 460195. **NELAP Accredited.**

Non-Potable Water (Inorganic Parameters: EPA 3005A,3015,1312,6010B,6010C,SM4500S-D, SM4500-CN-CE, Lachat 10-204-00-1-X. Organic Parameters: EPA 8260B)

Solid & Hazardous Waste (Inorganic Parameters: EPA 3050B, 1311, 1312, 6010B, 6010C, 9030B, 9010B, 9012A, 9014. Organic Parameters: EPA 5035, 5030B, 8260B.)

Department of Defense Certificate/Lab ID: L2217.

Drinking Water (Inorganic Parameters: SM 4500H-B. Organic Parameters: EPA 524.2, 504.1.)

Non-Potable Water (Inorganic Parameters: EPA 200.7, 200.8, 6010B, 6020, 245.1, 245.2, 7470A, 9040B, 300.0, 332.0, 6860, 353.2, 410.4, 9060, 1664A, SM 4500CN-E, 4500H-B, 4500NO3-F, 5220D, 5310C, 2320B, 2540C, 3005A, 3015, 9010B, 9056. Organic Parameters: EPA 8260B, 8270C, 8330A, 625, 8082, 8081A, 3510C, 5030B, MassDEP EPH, MassDEP VPH.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 200.7, 6010B, 7471A, 9010, 9012A, 6860, 1311, 1312, 3050B, 7196A, 9010B, 3500-CR-D, 4500CN-CE, 2540G, Organic Parameters: EPA 8260B, 8270C, 8330A/B-prep, 8082, 8081A, 3540C, 3546, 3580A, 5035A, MassDEP EPH, MassDEP VPH.)

The following analytes are not included in our current NELAP/TNI Scope of Accreditation:

EPA 8260B: Freon-113, 1,2,4,5-Tetramethylbenzene, 4-Ethyltoluene. **EPA 8330A:** PETN, Picric Acid, Nitroglycerine, 2,6-DANT, 2,4-DANT. **EPA 8270C:** Methyl naphthalene, Dimethyl naphthalene, Total Methylnaphthalenes, Total Dimethylnaphthalenes, 1,4-Diphenylhydrazine (Azobenzene). **EPA 625:** 4-Chloroaniline, 4-Methylphenol. Total Phosphorus in a soil matrix, Chloride in a soil matrix, TKN in a soil matrix, NO₂ in a soil matrix, NO₃ in a soil matrix, SO₄ in a soil matrix.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

Volatile Organics in Air

Canisters were released from the laboratory on December 27, 2011.

The canister certification results are provided as an addendum.

L1200012-01, -03, -04 and WG512341-05 were diluted and re-analyzed in order to quantitate the samples within the calibration range. The result should be considered estimated, and is qualified with an E flag, for any compound that exceeded the calibration on the initial analysis. The re-analysis was performed only for the compound that exceeded the calibration range.

L1200012-02, -04, and -05 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the samples.

Project Name: EXTELL
Project Number: 11454-0002

Lab Number: L1200012
Report Date: 01/09/12

Case Narrative (continued)

L1200012-02 + 04 results for 2-Hexanone should be considered estimated due to co-elution with a non-target peak.

The WG512341-3 LCS recovery for 1,4-Dioxane (134%) is above the upper 130% acceptance limit. None of the samples associated with this LCS have reportable concentrations of this analyte.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.
C	- Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
D	- Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
E	- Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
G	- The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
H	- The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
I	- The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
M	- Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
NJ	- Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

Report Format: Data Usability Report

Project Name: EXTELL
Project Number: 11454-0002

Lab Number: L1200012
Report Date: 01/09/12

Data Qualifiers

- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

Project Name: EXTELL
Project Number: 11454-0002

Lab Number: L1200012
Report Date: 01/09/12

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certificate/Approval Program Summary

Last revised January 3, 2012 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

Connecticut Department of Public Health Certificate/Lab ID: PH-0141.

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

Air & Emissions (EPA TO-15.)

New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: EPA 245.7, 1631E, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081B, 8082A, 8260B, 8270C, 8015D.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 3060A, 6020A, 7471A, 9040B, 9045C, 7196A. Organic Parameters: SW-846 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 5035, 8260B, 8270C, 8015D, 8082A, 8081B.)

New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: SW-846 1312, 3010, 3020A, SM2320B, SM2540D, 2540G, EPA 180.1, 1631E, SW-846 7470A, 9040B, 6020, 9050A. Organic Parameters: SW-846 3510C, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8015B 8081A, 8082, 8260B, 8270C)

Solid & Chemical Materials (Inorganic Parameters: SW-846 6020, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 7474, 9040B, 9045C, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 8015B.)

Atmospheric Organic Parameters (EPA TO-15)

Biological Tissue (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610C, 3630C, 3640A)

New York Department of Health Certificate/Lab ID: 11627. **NELAP Accredited.**

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 245.7, 7470A, 9014, 9040B, 9050, 120.1, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 3020A. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

Air & Emissions (EPA TO-15.)

Pennsylvania Certificate/Lab ID: 68-02089 **NELAP Accredited**

Solid & Hazardous Waste (Inorganic Parameters: EPA 6020A, 7471B, 7474. Organic Parameters: EPA 3050B, 3540C, 3630C, 8270C, 8081B, 8082A.)

Rhode Island Department of Health Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to LA-DEQ Certificate for Non-Potable Water.

Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

Solid & Chemical Materials (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

Air (Organic Parameters: EPA TO-15)

Washington State Department of Ecology Certificate/Lab ID: C954. *Non-Potable Water* (Inorganic Parameters: SM2540D, 180.1, 1631E.)

Solid & Chemical Materials (Inorganic Parameters: EPA 6020, 7470, 7471, 7474, 9045C, 9050A, 9060. Organic Parameters: EPA 8081, 8082, 8015 Mod, 8270.)

Virginia Division of Consolidated Laboratory Services Certificate/Lab ID: 460194. **NELAP Accredited.**

Non-Potable Water (Inorganic Parameters: EPA 3020A, 6020A, 245.7, 9040B, SM4500H-B. Organic Parameters: EPA 3510C, 3640A, 3660B, 3665A, 8270C, 8270D, 8082A, 8081B.)

Solid & Chemical Materials (Inorganic Parameters: EPA 6020A, 7470A, 7471B, 9040B, 9045C, 3050B, 3051. Organic Parameters: EPA 3540C, 3580A, 3630C, 3640A, 3660B, 3665A, 3570, 8270C, 8270D, 8081B, 8082A, 8015D.)

U.S. Army Corps of Engineers

Department of Defense Certificate/Lab ID: L2217.01.

Non-Potable Water (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 5030B, 8260B, 8270C, 8270C-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 1311, 1312, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 5035A, 8260B, 8270C, 8270-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015D.)

Air & Emissions (EPA TO-15.)

Analytes Not Accredited by NELAP

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl. **TO-15**: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.
