EXECUTIVE SUMMARY

The Remedial Investigation Report (RIR) provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy pursuant to RCNY§ 43-1407(f). The remedial investigation (RI) described in this document is consistent with applicable guidance.

Site Location and Current Usage

The Site is located at 320-328 West 36th Street in the Midtown section in Manhattan, New York and is identified as Block 759 and Lot 55 on the New York City Tax Map. Figure 1 shows the Site location. The Site is 8,145-square feet and is bounded by West 36th Street, followed by a 17-story building to the north, a 25-story hotel under construction to the south, a 5-story mixed use building to the east, and a 5-story mixed use building to the west. Currently, the Site is a vacant parking garage and contains a fully built out 2-story building with a full cellar. The cellar is currently 9'3" in depth.

Summary of Proposed Redevelopment Plan

The proposed future use of the Site will consist of a 29-story hotel. Layout of the proposed site development is presented in Figure 2. The current zoning designation is commercial (C6-4M). The proposed use is consistent with existing zoning for the property.

The entire current building is projected to be demolished. The future cellar will be installed to a depth of 13'8' below grade and entails a full build out of the property. There will be an elevator pit installed 7'6" below the cellar. This will require an additional 4'5" of soil and bedrock to be excavated from the site and approximately 2,400 tons of materials excavated. The elevator pit will be installed into the groundwater table. The proposed cellar will contain utility rooms, administrative offices, lockers and a kitchen. The first floor at grade will contain the hotel lobby, restaurant, additional offices and an outdoor terrace on the south side of the property. Floors 2 through 26 will be utilized for hotel lodging and floors 27 through 29 will be mechanical rooms. The projected final height of the building will be 286'8".

Summary of Past Uses of Site and Areas of Concern

A Phase I Environmental Site Assessment was completed by Merritt Environmental Consulting Corp. on October 18th, 2012. The most recent use of the property was as a two story-

parking garage with a full cellar. The Phase I indicates that the property was utilized as stores and dwellings from 1911 through 1950 and as a parking garage from 1968 through 2012. The Phase I indicates two 550-gallon underground storage tanks (USTs) in the basement of the property that were abandoned in place with concrete slurry in March of 2001. In addition, the Phase I indicates an “E”-designation (E-137) for Window Wall Attenuation and Alternate Ventilation and Gasoline Storage Tanks* Testing Protocol.

The AOCs identified for this site include:

1. Location of 2 abandoned 550-gal USTs.

Summary of the Work Performed under the Remedial Investigation

AC 320 Hotel Partners LLC performed the following scope of work:

1. Conducted a Site inspection to identify AOCs and physical obstructions (i.e. structures, buildings, etc.);
2. Performed a geophysical investigation to determine the precise locations of the abandoned USTs;
3. Installed eight soil borings across the entire project Site, and collected eleven soil samples for chemical analysis from the soil borings to evaluate soil quality;
4. Installed one temporary groundwater monitoring well at the Site and collected one groundwater sample for chemical analysis to evaluate groundwater quality;
5. Installed five soil vapor probes around Site and collected five samples for chemical analysis.

Summary of Environmental Findings

1. The property is approximately 36’ above sea level.
2. Depth to groundwater ranges from approximately 6 to 8 feet below the cellar level at the Site or approximately 15 to 17 feet below street level.
3. Accurate depths to groundwater were not determined during this investigation. Therefore, groundwater flow was not determined beneath the Site.

4. Depth to bedrock ranges from 1 to 18 feet below cellar surface at the Site or approximately 10 to 27 feet below street level.
5. The stratigraphy of the site, from the surface down, consists of red-brown coarse to fine sand with some silt, clay and gravel overlying bedrock.
6. Soil/fill samples collected during the RI were compared to NYSDEC Part 375-6.8 Unrestricted Use (Track 1) and Restricted Residential Use (Track 2) Soil Cleanup Objectives (SCOs). Soil sampling results detected trace concentrations of acetone and several SVOCs soil samples. No VOCs, SVOCs or PCBs were detected above Unrestricted Use Track 1 SCOs. One pesticide, 4,4'-DDT was detected above its Track 1 with a concentration of 8.57 µg/kg. Metals including lead (max of 158 µg/kg), mercury (max of 0.775 µg/kg) and zinc (max of 261 µg/kg) were detected above the Unrestricted Use SCOs. No compounds were detected above Track 2 SCOs or below the shallow 0-2' depth. Overall, the soil chemistry is unremarkable and does not indicate any disposal of historic fill materials and no hotspots were identified.
7. Groundwater samples collected during the RI were compared to NYSDEC 6NYCRR Part 703.5 Groundwater Quality Standards (GQS). Groundwater results showed no SVOCs were detected at concentrations exceeding GQS. Three VOCs were detected above their corresponding groundwater standards including, benzene (1.4 µg/L), toluene (7.4 µg/L) and p & m xylenes (6.9 µg/L). Several metals were identified in groundwater and only cobalt (16 µg/L), magnesium (49,100 µg/L), manganese (3,020 µg/L) and sodium (240,000 µg/L) exceeded their corresponding GQSs.
8. Soil vapor samples collected during the RI were compared to the compounds listed in Table 3.1 Air Guideline Values Derived by the NYSDOH located in the New York State Department of Health (NYSDOH) Final Guidance for Evaluating Soil Vapor Intrusion. All of the detected compounds were below their respective guidance values. Soil vapor samples showed moderate levels of petroleum related and trace levels of chlorinated VOCs in all soil vapor samples. Overall, the highest concentrations were detected for Tetrahydrofuran at 460 ug/m³. Petroleum related BTEX compounds were detected at maximum concentrations of 789 ug/m³. Chlorinated VOC, tetrachloroethene was detected in one of the samples at a concentration of 3.2 µg/m³. Carbon tetrachloride, trichlorethene and 1,1,1-trichloroethane were not detected in any soil vapor samples. The

detected concentration of tetrachloroethene was below the monitoring level range established by NYSDOH.

REMEDIAL INVESTIGATION REPORT

1.0 SITE BACKGROUND

AC 320 Hotel Partners LLC has enrolled in the New York City Voluntary Cleanup Program (NYC VCP) to investigate and remediate an 8,145-square foot site located at 320-328 West 36th Street in the Garment District of Manhattan, New York. Commercial use is proposed for the property. The RI work was performed between December 19th, 2014 and January 6th, 2015. This RIR summarizes the nature and extent of contamination and provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy that is protective of human health and the environment consistent with the use of the property pursuant to RCNY§ 43-1407(f).

1.1 Site Location and Current Usage

The Site is located at 320-328 West 36th Street in the Midtown section in Manhattan, New York and is identified as Block 759 and Lot 55 on the New York City Tax Map. Figure 1 shows the Site location. The Site is 8,145-square feet and is bounded by West 36th Street, followed by a 17-story building to the north, a 25-story hotel under construction to the south, a 5-story mixed use building to the east, and a 5-story mixed use building to the west. Currently, the Site is a vacant parking garage and contains a fully built out 2-story building with a full cellar. The cellar is currently 9'3" in depth.

1.2 Proposed Redevelopment Plan

The proposed future use of the Site will consist of a 29-story hotel. Layout of the proposed site development is presented in Figure 2. The current zoning designation is commercial (C6-4M). The proposed use is consistent with existing zoning for the property.

The entire current building is projected to be demolished. The future cellar will be installed to a depth of 13'8' below grade and entails a full build out of the property. There will be an elevator pit installed 7'6" below the cellar. This will require an additional 4'5" of soil and bedrock to be excavated from the site and approximately 2,400 tons of materials excavated. The elevator pit will be installed into the groundwater table. The proposed cellar will contain utility

rooms, administrative offices, lockers and a kitchen. The first floor at grade will contain the hotel lobby, restaurant, additional offices and an outdoor terrace on the south side of the property. Floors 2 through 26 will be utilized for hotel lodging and floors 27 through 29 will be mechanical rooms. The projected final height of the building will be 286'8".

1.3 Description of Surrounding Property

There are no nearby sensitive receptors such as schools, hospitals, and day care facilities within a 250 to 500-foot radius.

Figure 3 shows the surrounding land usage.

2.0 SITE HISTORY

2.1 Past Uses and Ownership

A Phase I Environmental Site Assessment was completed by Merritt Environmental Consulting Corp. on October 18th, 2012. The most recent use of the property was as a two story-parking garage with a full cellar. The Phase I indicates that the property was utilized as stores and dwellings from 1911 through 1950 and as a parking garage from 1968 through 2012. The Phase I indicates two 550-gallon underground storage tanks (USTs) in the basement of the property that were abandoned in place with concrete slurry in March of 2001. In addition, the Phase I indicates an “E”-designation (E-137) for Window Wall Attenuation and Alternate Ventilation and Gasoline Storage Tanks* Testing Protocol.

2.2 Previous Investigations

A Geotechnical Evaluation was completed by URS on February 17th, 2014. The evaluation included the installation of four test borings to identify soil, rock and groundwater conditions at the property. The evaluation concluded shallow bedrock is present beneath the property ranging from 1’ below cellar level on the eastern side of the property to 18’ below cellar on the southwestern side of the property. The report estimated that groundwater is likely to be located 14.5’ below ground surface. No samples were collected for analysis.

2.3 Site Inspection

A site inspection was conducted on March 4th, 2014 by Theresa Burkard. The site was an active parking garage and there was little access to the cellar due to cars. The location of the abandoned tanks was not determined at that time.

2.4 Areas of Concern

The AOCs identified for this site include:

1. Location of 2 abandoned 550-gal USTs.

The Phase 1 Report and Geotechnical Evaluation are presented in Appendix 1.

3.0 PROJECT MANAGEMENT

3.1 Project Organization

The Qualified Environmental Profession (QEP) responsible for preparation of this RIR is Paul P. Stewart.

3.2 Health and Safety

All work described in this RIR was performed in full compliance with applicable laws and regulations, including Site and OSHA worker safety requirements and HAZWOPER requirements.

3.3 Materials Management

All material encountered during the RI was managed in accordance with applicable laws and regulations.

4.0 REMEDIAL INVESTIGATION ACTIVITIES

AC 320 Hotel Partners LLC performed the following scope of work:

1. Conducted a Site inspection to identify AOCs and physical obstructions (i.e. structures, buildings, etc.);
2. Performed a geophysical investigation to determine the precise locations of the abandoned USTs;
3. Installed eight soil borings across the entire project Site, and collected eleven soil samples for chemical analysis from the soil borings to evaluate soil quality;
4. Installed one temporary groundwater monitoring well at the Site and collected one groundwater sample for chemical analysis to evaluate groundwater quality;
5. Installed five soil vapor probes around Site and collected five samples for chemical analysis.

4.1 Geophysical Investigation

The geophysical survey was completed on December 29th, 2014. The survey encompassed all accessible areas of the cellar. Field notes from the survey are contained in Appendix 2.

The survey was performed utilizing an SIR-2000 Ground-Penetrating Radar (GPR) unit at a range to allow for the identification of anomalies to a depth of 10 feet below ground surface. At the time of the survey, reflections indicative of two 550-gal USTs were observed along the south side of the property. The anomalies were observed to be approximately 2-3' below the cellar floor and 10.5' by 10.5' wide. The locations of the suspected USTs are indicated in Figure 5.

GPR is primarily used as a preliminary survey of a property for the development of subsurface information prior to a formal site assessment. Surface cover or obstructions, subsurface soil types and buried debris can mask or conceal the presence and precise locations of underground structures or even suggest their presence when none exist. The presence, absence or precise locations of underground structures indicated during a GPR survey should be confirmed by excavation, subsurface sampling or other invasive procedures.

4.2 Borings and Monitoring Wells

Drilling and Soil Logging

Eight soil borings were installed around the site at the locations indicated in Figure 5. All samples were installed in the basement of the existing building. Each boring was installed utilizing Geoprobe-style portable hydraulic equipment in combinations with four-foot macro core soil samplers containing dedicated acetate liners. All down hole drilling equipment was decontaminated between sampling events to minimize the possibility of cross contamination.

Soil was continuously sampled in each soil boring from ground surface to a depth of 9 feet below ground surface (bgs) or the depth that bedrock was encountered. All soil samples were screened for volatile organic compounds (VOCs) utilizing a Photovac 2020 Photo Ionization Detector (PID) and visually examined for lithology and the presence of contamination. None of the soil borings exhibited elevated PID readings or staining.

SB-1 was installed to a depth of 6' bgs at which depth bedrock was encountered. A soil sample was collected from the 0-2' depth. Soils were saturated at 5.5' bgs and there was not enough soil recovery to sample deeper. SB-2 was installed to a final depth of 9' bgs. Groundwater was encountered at approximately 8' bgs. Samples were collected from the shallow soils 0-2' and the groundwater interface labeled 6-8'. SB-3 was installed to a final depth of 9' bgs at which depth refusal was encountered. Groundwater was encountered at approximately 8' bgs. Samples were collected from the shallow soils 0-2' and the groundwater interface 6-8'. SB-4 was installed to a depth of 7' bgs at which depth bedrock was encountered. Soils were saturated at 6.2' bgs. Samples were collected from the 0-2' depth and the groundwater interface 4-6'. SB-5 was installed to a depth of 3' where bedrock was encountered. A sample was collected from 0-2'. SB-6 encountered bedrock at 3' and a sample was collected from 0-2'. SB-7 encountered bedrock at 2' and a sample was collected from 0-2'. Lastly SB-8 encountered bedrock at 1' bgs and a sample was collected from 0-1'.

Eleven soil samples were collected from the site and placed in appropriate laboratory issued containers. Samples were submitted to York Analytical Laboratories, Inc. (NYSDOH #10854). Soil samples were analyzed for VOCs in accordance with EPA method 8260, SVOCs in accordance with EPA method 8270, TAL metals in accordance with EPA methods 6010 and 7471 and lastly PCBs and Pesticides in accordance with EPA methods 8081 and 8082.

Boring logs were prepared and are attached in Appendix 3. A map showing the location of soil borings and monitor wells is shown in Figure 4.

Groundwater Monitoring Well Construction

Groundwater quality was determined during this investigation through the installation and sampling of one temporary monitoring well. The sample was collected utilizing a two foot steel groundwater sampler in combination with 4' hollow steel rods. The location of the groundwater sampling point is depicted in Figure 4.

Survey

Due to the temporary construction of the wells and limited groundwater recovery a formal survey of the sampling point was not conducted.

Water Level Measurement

Ground water was generally encountered between 6 and 8 feet below the basement floor. Due to the temporary construction of the monitoring wells and limited groundwater recovery an accurate measurement of depth to water was not determined.

4.3 Sample Collection and Chemical Analysis

Sampling performed as part of the field investigation was conducted for all Areas of Concern and also considered other means for bias of sampling based on professional judgment, area history, discolored soil, stressed vegetation, drainage patterns, field instrument measurements, odor, or other field indicators. All media including soil, groundwater and soil vapor have been sampled and evaluated in the RIR. Discrete (grab) samples have been used for final delineation of the nature and extent of contamination and to determine the impact of contaminants on public health and the environment. The sampling performed and presented in this RIR provides sufficient basis for evaluation of remedial action alternatives, establishment of a qualitative human health exposure assessment, and selection of a final remedy.

Soil Sampling

Eleven soil samples were collected for chemical analysis during this RI. Data on soil sample collection for chemical analyses, including dates of collection and sample depths, is reported in Tables 1 through 4. Figure 4 shows the location of samples collected in this investigation. Laboratories and analytical methods are shown below.

All equipment was properly decontaminated between each sampling event and after each use to prevent the contamination of samples. Care was taken to store and transport the equipment away from cleaning solvents and gasoline. Cleaned equipment was handled as little as possible

prior to use and disposable gloves were worn during the handling. Sampling field equipment was field decontaminated according to the following steps:

- Washed with solution of non-phosphate detergent in tap water;
- Rinsed with tap water;
- Rinsed with distilled/de-ionized water;
- Rinsed with methanol;
- Rinsed with distilled/de-ionized water;
- Air dry.

A decontamination area was set up in a non-contaminated area of the site, away from the work area. A polyethylene tarp was placed on the ground and the cleaning/rinsing solutions were stored in laboratory wash bottles to reduce waste generation. Scrub brushes were used to remove residue from the equipment. All rinse solutions were collected into one-gallon polyethylene containers and transported to ACT's Port Washington office for disposal as manifested laboratory waste.

Groundwater Sampling

One groundwater sample was collected for chemical analysis during this RI. Groundwater sample collection data is reported in Tables 5 through 7. Sampling logs with information on purging and sampling of groundwater monitor wells is included in Appendix 2. Groundwater at the property was found to be extremely silty and therefore there was not enough recovery from MW-2 to analyze for PCBs and Pesticides. Figure 4 shows the location of groundwater sampling. Laboratories and analytical methods are shown below.

Soil Vapor Sampling

5 soil vapor probes were installed and 5 soil vapor samples were collected for chemical analysis during this RI. Soil vapor sampling locations are shown in Figure 4. Soil vapor sample collection data is reported in Table 8. Soil vapor sampling logs are included in Appendix 2. Methodologies used for soil vapor assessment conform to the *NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006*.

Chemical Analysis

Chemical analytical work presented in this RIR has been performed in the following manner:

Results of Chemical Analyses

Laboratory data for soil, groundwater and soil vapor are summarized in Tables 1 through 8, respectively. Laboratory data deliverables for all samples evaluated in this RIR are provided in digital form in Appendix 3.

5.0 ENVIRONMENTAL EVALUATION

5.1 Geological and Hydrogeological Conditions

Stratigraphy

The topography of the site is generally level. The nearest surface water body is the Hudson River, located approximately 0.7 miles to the west. The stratigraphy of the site, from the surface down, consists of red-brown coarse to fine sand with some silt, clay and gravel overlying bedrock. Bedrock ranges at the property from 2'8" bgs on the northeastern side of the property to 1' bgs on the eastern side of the property. The bedrock ranges from 6' bgs on the southeastern side of the property to 18' bgs on the southwestern side of the property.

Hydrogeology

Groundwater is expected to be perched on top of the bedrock and traveling through fractures. Ground water was generally encountered between 6 and 8 feet below the basement floor or approximately 15 to 17 feet below street level. An accurate depth to groundwater was not determined during this investigation.

5.2 Soil Chemistry

Data collected during the RI is sufficient to delineate the vertical and horizontal distribution of contaminants in soil/fill at the Site. A summary table of data for chemical analyses performed on soil samples is included in Tables 1 through 4. Figure 5 shows the location and posts the values for soil/fill that exceed the 6NYCRR Part 375-6.8 Track 1 Soil Cleanup Objectives.

It can be seen from table 1 that no VOC's were detected above Track 1 Unrestricted Use SCOs in any of the soil samples. Acetone was the only VOC detected in all of the samples at trace concentrations and is commonly utilized as a laboratory solvent. Its presence in the samples is a possible artifact from laboratory equipment.

Table 2 shows the SVOCs detected in the soil samples obtained at the property. No SVOCs were detected above Track 1 SCOs. The most prevalent compound was bis(2-ethylhexyl)phthalate detected at trace concentrations in samples SB-4 (0-2), SB-5 (0-2), SB-6 (0-2), SB-7 (0-2) and SB-8 (0-2) with a maximum concentration of 212 µg/kg. The highest concentration of a compound was pyrene in SB-6 (0-2) with a concentration of 417 µg/kg, which is still well below it's Track 1 SCO. The compounds detected are commonly found in historic fill

materials. Burning petroleum products such as coal, tar, oil and gas can create SVOCs as a byproduct.

Table 3 summarizes the concentrations of PCBs and Pesticides detected in the soil samples. SB-6 (0-2) and SB-7 (0-2) were the only samples to contain detections of Pesticides. 4,4'-DDT was detected above its Track 1 SCO in SB-6 (0-2) and SB-7 (0-2) with a maximum concentration of 8.57 µg/kg. No other pesticides were detected above Track 1 SCOs. No PCBs were detected Track 1 SCOs. Pesticides are common compounds found at commercial properties and their presence at the property could be due to the historical usage of the site and surrounding area.

Concentrations of TAL metals in the soils at the site are summarized in Table 4. A total of 3 metals were detected in the soil borings above Track 1 SCOs. Lead was detected above its SCO in SB-6 (0-2) and SB-7 (0-2) with a maximum concentration of 158 µg/kg. Mercury was detected above its Track 1 SCO in SB-7 (0-2) with a concentration of 0.775 µg/kg. The last metal detected above its SCO was Zinc in SB-7 (0-2) with a concentration of 261 µg/kg. All remaining detections of metals were below soil cleanup objectives. Metals are commonly found at higher concentrations in urban areas due to the presence of fill materials. The highest concentrations of metals were detected in the shallow soils, indicating that groundwater is unlikely the source of contamination.

5.3 Groundwater Chemistry

Data collected during the RI is sufficient to delineate the distribution of contaminants in groundwater at the Site. A summary table of data for chemical analyses performed on groundwater samples is included in Table 5 through 7.

It can be seen from Table 5 that a total of 3 VOCs were detected above their respective groundwater quality standards (GQSs). Benzene was found to exceed its GQS of 0.7 µg/L with a concentration of 1.4 µg/L. Toluene exceeded its GQS of 5 µg/L with a concentration of 7.4 µg/L. Lastly, p & m xylenes were detected at a combined concentration of 6.9 µg/L, which exceeds the GQS of 5 µg/L. The other compounds detected were well below the GQSs and would be commonly found in the industrial and urban area that the site is located.

Table 6 shows the concentrations of semi-volatile organic compounds detected in the groundwater samples obtained at the site. No SVOC's were detected above their corresponding GQSs. Lastly, Table 7 shows that there were exceedences of four metals in dissolved metal concentrations in the groundwater sample. Cobalt was detected at a concentration of 16 µg/L,

which is above the GQS of 5 µg/L. Magnesium was detected above its GQS of 35,000 µg/L with a concentration of 49,100 µg/L. Manganese was detected at a concentration of 3,020 µg/L, which exceeds the GQS of 300 µg/L. Lastly, sodium was detected at a concentration of 240,000 µg/L, which is above the GQS of 20,000 µg/L.

Figure 5 shows the location and posts the values for groundwater that exceed the New York State 6NYCRR Part 703.5 Class GA groundwater standards.

5.4 Soil Vapor Chemistry

Data collected during the RI is sufficient to delineate the distribution of contaminants in soil vapor at the Site. A summary table of data for chemical analyses performed on soil vapor samples is included in Table 8.

As shown in Table 8, multiple VOCs were detected in soil vapor. SV-1 through SV-5 did not contain concentrations of VOCs above NYSDOH monitoring levels. Carbon tetrachloride, trichloroethene (TCE), and 1,1,1-tetrachloroethane were not detected in any soil vapor samples. Chlorinated VOC, tetrachlorethene (PCE) was detected in one sample (SV-5) with a concentration of 3.2 µg/m³. The detected concentration of tetrachloroethene was below the monitoring level range established by NYSDOH. Overall, the highest concentrations of compounds were detected for tetrahydrofuran at maximum of 460 ug/m³. Petroleum related BTEX compounds were detected at maximum concentrations of 789 ug/m³ in SV-1. None of the above compounds were detected above standards in soil or groundwater beneath the site. All of the compounds detected are commonly found in industrial solvents and petroleum products and their presence at the property is likely due to the historical usage of the surrounding area.

5.5 Prior Activity

Based on an evaluation of the data and information from the RIR, disposal of significant amounts of hazardous waste is not suspected at this site.

5.6 Impediments to Remedial Action

There are no known impediments to remedial action at this property.

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, AV, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined.

ZONE AE Base Flood Elevations determined.

ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of actual fan flooding, velocities also determined.

ZONE AR Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently derelict. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance flood.

ZONE AV Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.

ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.

ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood height.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE D Areas determined to be outside the 0.2% annual chance floodplain.

AREAS IN WHICH FLOOD RISKS ARE UNDETERMINED, BUT POSSIBLE

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1014-01 MASONRY EQUIVALENT EXIT ENCLOSURES.

(A) SCOPE: THIS RULE PROVIDES THE CONSTRUCTION REQUIREMENTS FOR MASONRY EQUIVALENT EXIT ENCLOSURES IN GROUPS R-1, R-2 and B OCCUPANCIES.

(B) REFERENCES: SEE SECTIONS 1014.2.1 (TWO EXITS AND EXIT ACCESS DOORWAYS, EXCEPTIONS 3 AND 4) AND 1019.1 (ENCLOSURES REQUIRED EXCEPTION 10) OF THE BUILDING CODE.

(C) FIELD WALL CONSTRUCTION REQUIREMENTS: A MASONRY EQUIVALENT EXIT ENCLOSURE CONSTRUCTED AS STUD AND WALL BOARD ASSEMBLY SHALL SATISFY THE FOLLOWING REQUIREMENTS:

(1) PRESCRIPTIVE STUD AND WALL BOARD ASSEMBLY: A COMPLIANT WALL ASSEMBLY SHALL BE SUBSTANTIALLY IDENTICAL TO, AND SHALL PROVIDE AN IMPACT RESISTANCE EQUIVALENT TO OR EXCEEDING, THE PERFORMANCE OF ONE (1) OF THE FOLLOWING:

(i) MATERIALS IMPACT RESISTANT WALL BOARD SHEATHED ON THE INTERIOR SURFACE OF THE EXIT ENCLOSURE WALL ASSEMBLY SHALL BE TESTED BY AN APPROVED TESTING AGENCY. THE WALL BOARD USED AS THE INTERIOR FACE PANEL SHALL BE LISTED BY AN APPROVED AGENCY TO ASTM C 1629-06, STANDARD CLASSIFICATION FOR ABUSE-RESISTANT NONDECORATED INTERIOR GYPSUM PANEL PRODUCTS AND FIBER-REINFORCED CEMENT PANELS, IMPACT CLASSIFICATION LEVEL 2, AND THE BASE LAYER PANEL SHALL BE A MINIMUM 1/2 INCH (16 MM) GYPSUM WALL BOARD APPLIED TO THE INTERIOR SURFACE OF THE EXIT ENCLOSURE WALL SHALL NOT REDUCE THE CLEAR WIDTH OF THE EXIT STAIRS BELOW THAT REQUIRED FOR MEANS OF EGRESS BY CHAPTER 10 OF THE BUILDING CODE.

(ii) ASSEMBLY: THE WALL ASSEMBLY SHALL BE AT LEAST TWO-HOUR FIRE RESISTANCE RATED.

(iii) INSTALLATION SHALL COMPLY WITH THE FOLLOWING:

(A) STUDS SHALL BE MINIMUM 3-1/2 INCH (89 MM) DEPTH COLD-FORMED STEEL FRAMING, AT LEAST 33 MILS THICK (20 GAUGE).

(B) VERTICAL STUDS SHALL BE SPACED AT A MAXIMUM DISTANCE OF 24 INCHES (610 MM), ON CENTER.

(C) RINNERS SHALL BE SECURELY ATTACHED AT THE FLOOR AND CEILING TO STRUCTURAL ELEMENT MEMBERS AND SHALL COMPLY WITH THE STRUCTURAL REQUIREMENTS OF THE BUILDING CODE.

(D) WALL BOARDS SHALL BE ATTACHED WITH NO. 8 SELF-DRILLING BULGE-HEAD SCREWS, 12 INCHES (305 MM), ON CENTER MAXIMUM, WITH A MINIMUM DEPTH OF 1/2 INCH (16 MM) PENETRATION INTO THE WALL CAVITY.

(E) JOINTS BETWEEN ADJOINING SHEETS OF WALL BOARD SHALL BE STAGGERED FROM BASE LAYER WITH FACE PANEL LAYER.

(2) PERFORMANCE-BASED REQUIREMENTS: FOR A WALL ASSEMBLY NOT CLASSIFIED IN SUBDIVISION (1) ABOVE, A MASONRY EQUIVALENT WALL ASSEMBLY SHALL SATISFY THE FOLLOWING REQUIREMENTS:

(i) MATERIALS: MATERIALS CONSTITUTING THE INTERIOR SURFACE OF THE EXIT ENCLOSURE WALL ASSEMBLY SHALL BE TESTED BY AN APPROVED TESTING AGENCY TO ASTM C1629, HARD BODY IMPACT CLASSIFICATION LEVEL 3.

(ii) ASSEMBLY: THE WALL ASSEMBLY SHALL HAVE A MINIMUM TWO-HOUR FIRE RESISTANCE RATING. THE WALL ASSEMBLY SHALL BE TESTED BY AN APPROVED TESTING AGENCY TO ASTM C1629, SOFT BODY IMPACT CLASSIFICATION LEVEL 2.

(iii) INSTALLATION: WALL ASSEMBLIES SHALL BE ANCHORED TO STRUCTURAL MEMBERS AND SHALL COMPLY WITH THE STRUCTURAL REQUIREMENTS OF THE BUILDING CODE.

4.1 EXECUTIVE SUMMARY

Merritt Environmental Consulting Corp. (MECC) was retained by Raber Enterprises, LLC to conduct a Phase I Environmental Site Assessment (ESA) at 321-325 West 35th Street & 320-328 West 36th Street, New York, New York 10001.

The on site investigation was conducted on October 8, 2012.

The current use of the site consists of a vacant office and warehouse building (321-323 West 35th Street) a parking garage driveway (325 West 35th Street) and a parking garage (326-328 West 36th Street).

At the time of our inspection, no access was possible to the building located at 321-323 West 35th Street. However, a prior Phase I Report conducted on February 26, 2001 by Merritt Engineering Consultants (MEC) did not reveal any Areas of Concern (AOCs) within the building.

Based on our site reconnaissance, database review and historical investigation, the following Recognized Environmental Conditions (RECs) were noted at the time of our inspection.

A Recognized Environmental Condition means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under compliance with laws.

The subject property is documented as "E" designated lots at the NYC Department of Buildings:

**Lot 55, Tax Block 759
320 West 36th Street
E-No. E-137
Effective Date: 01/19/05
Satisfaction date: Not Reported
Description: Window Wall Attenuation & Alternate Ventilation, Underground Gasoline Storage Tanks* Testing Protocol**

**Lot 27, Tax Block 759
321 West 35^h Street
E-No. E-137
Effective Date: 01/19/05
Satisfaction date: Not Reported
Description: Window Wall Attenuation & Alternate Ventilation, Underground Gasoline Storage Tanks* Testing Protocol**

Lot 26, Tax Block 759
325 West 35th Street
E-No. E-137
Effective Date: 01/19/05
Satisfaction date: Not Reported
Description: Window Wall Attenuation & Alternate Ventilation, Underground Gasoline Storage Tanks* Testing Protocol

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCDEP, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

As previously outlined, an "E" designation only needs to be complied with during the redevelopment of a site. Part of the "E" designation submittal includes architectural drawings on the proposed development.

The existence of an "E" designation does not automatically assume that any contamination or Underground Storage Tanks (USTs) exist. The "E" designation is a "flag" levied on the site to be further evaluated.

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

In addition, no de minimis conditions were noted.

A de minimis condition is one that generally does not present a material risk of harm to public health or the environment and that generally would not be subject of an enforcement action if brought to the attention of appropriate governmental agencies (excluding local asbestos & lead situations).

NON-SCOPE CONSIDERATIONS

There may be environmental issues or conditions at a property that parties may wish to assess in connection with commercial real estate that are outside the scope of this practice (the non-scope considerations). Some substances may be present on a property in quantities and under conditions that may lead to contamination of the property or of nearby properties but are not included in CERCLA's definition of hazardous substances (42 U.S.C. §9601(14)) or do not otherwise present potential CERCLA liability. In any case, they are beyond the scope of this practice. There may be standards or protocols for assessment of potential hazards and conditions associated with non-scope conditions developed by governmental entities, professional organizations, or other private entities. Asbestos-Containing Building Materials, Lead-Based Paint, and Radon are several non-scope considerations that persons may want to assess in connection with commercial real estate.

ITEM

1	At the time of our inspection, no access was possible to 321-323 West 35 th Street. Based on the age of the building, Asbestos Containing Materials (ACM) and Lead Based Paint (LBP) are assumed to be present. Since the building is currently vacant, any potential ACM and LBP as well as any mold encountered should be addressed during any renovations /redevelopment of the site.

The following Historical Recognized Environmental Conditions (HRECs) were reported:

A Historical Recognized Environmental Condition (HREC) is an environmental condition which in the past would have been considered a Recognized Environmental Condition (REC), but which may or may not be considered a recognized environmental condition currently. Such as a past release of any hazardous substances or petroleum products which has been remediated, with such remediation accepted by the responsible regulatory agency (for example, as evidenced by the issuance of a no further action letter or equivalent).

There are two (2) 550-gallon underground storage tanks (USTs), which have been abandoned in place, located in basement area of 320-328 West 36th Street. The tanks were utilized to house gasoline.

From March 20-22, 2001, proper abandonment of the tanks was conducted. The tanks were drained of gasoline/water mix (approximately 1,100 gallons) and disposed of. Soil samples were taken and analyzed. The results did not indicate any contamination.

On Saturday, March 24, 2001, the tanks were filled with concrete slurry. The slab, which was broken up during the investigation was repaired. A New York City Fire Department Affidavit was filed upon completion of the job.

4.2.4 LIMITATIONS AND EXCEPTIONS

The contents of this report are correct to our knowledge and belief. This report and conclusions stated herein are, however, limited to actual knowledge based upon a visual inspection of the Property, the examination of readily available public records concerning the current and prior use of the Property, and interviews with individuals knowledgeable about present and past property uses.

Merritt Environmental Consulting Corp. has performed this Phase I Environmental Site Assessment (ESA) of the Property in accordance with the detailed scope of work in section 4.2.2.

Merritt Environmental Consulting Corp. cannot guarantee that the Property is completely free of hazardous substances or other materials or conditions that could subject the Client to potential liability. The presence or absence of any such condition can only be confirmed through the collection and analysis of soil and groundwater samples, as well as through testing building materials that may contain asbestos or lead paint. This is beyond the scope of the investigation.

Merritt Environmental Consulting Corp. has no interest other than professional in this Assessment and neither its performance, nor compensation for same, is contingent upon the findings and recommendations that are represented herein.

Transfer Property Acts

Many states have enacted property transfer laws that require notification of environmental conditions to a buyer. This ESA is not designed to meet those parameters or determine if a transfer act applies to the subject site

4.2.5 SPECIAL TERMS AND CONDITIONS

There are no special terms or conditions to the content of the report that are in addition to the scope outlined in Section 4.2.2.

4.2.6 RELIANCE

This Phase I Assessment was performed at the client's request utilizing methods and procedures that are consistent with acceptable professional standards ASTM-E1527-05.

The report has been prepared for the sole use of MECC's client. No other party may use the report without the written authority of MECC.

4.3) SITE DESCRIPTION

4.3.1 LOCATION AND LEGAL DESCRIPTION

The property address is 321-325 West 35th Street & 320-328 West 36th Street. The legal site address is Block 759, Lots 26, 27 & 55. The site is located in the Fashion District section of Manhattan, New York.

4.3.2 SITE AND VICINITY GENERAL CHARACTERISTICS

The current site is situated on a plot size 13,511 square feet.

The weather conditions during our on-site inspection consisted of cloudy skies. The temperature was approximately 52°.

4.3.3 CURRENT USE OF THE PROPERTIES

The current use of the site consists of a vacant office and warehouse building (321-323 West 35th Street) a parking garage driveway (325 West 35th Street) and a parking garage (326-328 West 36th Street).

At the time of our inspection, no access was possible to the building located at 321-323 West 35th Street. However, a prior Phase I Report conducted on February 26, 2001 by Merritt Engineering Consultants (MEC) did not reveal any Areas of Concern (AOCs) within the building.

4.3.4 DESCRIPTIONS OF STRUCTURES, ROADS AND OTHER IMPROVEMENTS

- A. The current site consists of a vacant 2-story office and warehouse building (321-323 West 35th Street), a parking garage driveway (325 West 35th Street) and a 2-story parking garage with basement and roof top parking (320-328 West 36th Street). The site is located on a plot size approximately 13,511 square feet. There is a basement which houses the utilities located in the parking garage (320-328 West 36th Street). There are no basements or subbasements in the vacant office and warehouse building (321-323 West 35th Street) or driveway (325 West 35th Street).

At the time of our inspection, no access was possible to the building located at 321-323 West 35th Street. However, a prior Phase I Report conducted on February 26, 2001 by Merritt Engineering Consultants (MEC) did not reveal any Areas of Concern (AOCs) within the building.

- B. The site is located on the north side of West 35th Street and south side of West 36th Street between the corners of 9th Avenue and 8th Avenue.
- C. There are no working heating systems located in the 2-story parking garage (320-328 West 36th Street). At the time of our inspection, no access was possible to 321-323 West 35th Street, therefore, we cannot comment on the location of the utilities for this building.

D. STORM AND SANITARY DISCHARGE

There are no on-site sanitary services such as cesspools or septic tanks located on the property. The sanitary discharge for this site empties into the New York City sewer system.

E. WATER SUPPLY

The U.S. Environmental Protection Agency estimates that drinking water can comprise 20% or more of a person's total exposure to lead. Although lead in drinking water is rarely the single cause of lead poisoning, it can significantly increase a person's total lead exposure. Infants who are fed baby formula or drinks mixed with hot water from the tap are the most vulnerable to lead in drinking water. Lead solder can leach into the water supply. Standing water in the piping system can aid in the leaching process.

The EPA action level for lead in drinking water is 15 parts per billion, (PPB).

A sample with lead levels that equal or exceed 15 PPB is considered to have elevated levels of lead, and it is recommended that response action be taken. This response action may include additional testing, replacement of plumbing components, or an operations and maintenance program.

FINDINGS

A 1" copper water main enters the 2-story parking garage (320-328 West 36th Street) from West 36th Street. The main is connected to a water meter located in the basement.

At the time of our inspection, no access was possible to 321-323 West 35th Street, therefore, we cannot comment on the type of water main present.

The domestic water is supplied by New York City through aqueducts from upstate reservoirs.

The parking garage driveway (325 West 35th Street) has no water service.

There are no private ground water wells servicing this property.

No testing of the water was conducted under this scope.

F. GARBAGE DISPOSAL

There are currently no active incinerators located on the property. The garbage to be disposed of is placed the front of the 320-328 West 36th Street building in portable cans with covers. These containers are picked up several times per week by private sanitation.

Spill Logs/LTANKS list – New York State Department of Environmental Conservation (NYSDEC) has a computerized list of spills that have occurred as of 1986, including the present status of the sites. In addition, the leaking tank (LTANKS) database was also reviewed for reported incidents in the area.

Findings: 88 LTANKS located within a ½-mile radius.

State registered tanks - state lists of storage tanks required to be registered under Subtitle I, Section 9002 of RCRA.

Findings: No registered tanks located on site.
167 registered tank sites located within a 1/8-mile radius.

E Designation- According to a NYCDOB memorandum (12/23/03), "E" designated lots are amendments to the New York City Zoning Maps that may include environmental designations of certain tax lots that have physical or historical evidence of uses related to hazardous materials. Zoning Resolution 11-15 provides that the Department of Buildings may not issue a building permit for work on a tax lot labeled "E", until the Department of Buildings is provided with a report from the Department of Environmental Protection stating that the environmental requirements for the lot have been met.

Findings: The subject property is listed as an "E" designated lot.

**Lot 55, Tax Block 759
320 West 36th Street
E-No. E-137
Effective Date: 01/19/05
Satisfaction date: Not Reported
Description: Window Wall Attenuation & Alternate Ventilation, Underground Gasoline Storage Tanks* Testing Protocol**

**Lot 27, Tax Block 759
321 West 35^h Street
E-No. E-137

Satisfaction date: Not Reported
Description: Window Wall Attenuation & Alternate Ventilation, Underground Gasoline Storage Tanks* Testing Protocol**

**Lot 26, Tax Block 759
325 West 35th Street
E-No. E-137
Effective Date: 01/19/05
Satisfaction date: Not Reported
Description: Window Wall Attenuation & Alternate Ventilation, Underground Gasoline Storage Tanks* Testing Protocol**

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCDEP, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

As previously outlined, an "E" designation only needs to be complied with during the redevelopment of a site. Part of the "E" designation submittal includes architectural drawings on the proposed development.

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

The existence of an "E" designation does not automatically assume that any contamination or Underground Storage Tanks (USTs) exist. The "E" designation is a "flag" levied on the site to be further evaluated.

4.5.2 ADDITIONAL RECORDS SEARCHED

Database	Radius Searched
1. Indian Reservation	1 Mile
2. Indian LUST	½ Mile
3. Indian UST	¼ Mile

The subject site is not listed in any of the additional database searches provided by Environmental Data Resources (EDR). No other environmental records were researched.

D. Topographic Maps

A topographic map (topo) is a color coded line-and-symbol representation of natural and selected artificial features plotted to a scale. Topos show the shape, elevation, and development of the terrain in precise detail by using contour lines and color coded symbols. The colors of the lines usually indicate similar classes of information. For example, topographic contours (brown); lakes, streams, irrigation ditches, etc. (blue); land grids and important roads (red); secondary roads and trails, railroads, boundaries, etc. (black).

Historical topographic maps are a valuable historical resource for documenting the prior use of a property and its surrounding area.

Topographic Maps of the site and immediate area were available for the years 1891, 1897, 1900, 1903, 1905, 1940, 1947, 1955, 1956, 1966, 1967, 1979, 1981, 1995.

4.5.4A DATA GAPS

No significant data gaps were noted within the historical research conducted by Merritt Environmental Consulting Corp (MECC).

4.5.5 HISTORICAL USE INFORMATION ON ADJOINING PROPERTIES

The above historical sources were reviewed by Merritt Environmental Consulting Corp. (MECC) for the adjoining properties on the north, south, east & west.

4.6) SITE RECONNAISSANCE

4.6.1 METHODOLOGY AND LIMITING CONDITIONS

At the time of our inspection, the following areas of 325 West 35th Street and 320-328 West 36th Street were accessed by Mr. John Perotti, of our staff: basement parking area, ground floor, 2nd floor and roof top parking areas, utilities areas and all accessible exterior areas of the site.

At the time of our inspection, no access was possible to the building located at 321-323 West 35th Street. However, a prior Phase I Report conducted on February 26, 2001 by Merritt Engineering Consultants (MEC) did not reveal any Areas of Concern (AOCs) within the building.

4.6.2 GENERAL SITE SETTING

North side of West 35th Street
South side of West 36th Street
Topography is flat

4.6.3 EXTERIOR OBSERVATIONS

No potential environmental conditions such as, dead vegetation, gas/chemical spills or storage drums were observed throughout the exterior areas at the time of our inspection.

4.6.4 INTERIOR OBSERVATIONS

The interior inspection of 325 West 35th Street and 320-328 West 36th Street revealed no evidence of any on-site staining of petroleum products, chemicals, or other hazardous materials.

Hydraulic equipment was observed in the basement area of the parking garage at 320-328 West 36th Street. The unit operates the ground floor hydraulic parking lifts.

At the time of our inspection, no access was possible to the building located at 321-323 West 35th Street. However, a prior Phase I Report conducted on February 26, 2001 by Merritt Engineering Consultants (MEC) did not reveal any Areas of Concern (AOCs) within the building.

4.6.5 UNDERGROUND STORAGE TANKS (UST) AND DRUMS

Each year, thousands of petroleum leaks and spills are reported to the Department of Environmental Conservation (DEC) / Department of Environmental Protection (DEP). Thousands of others may go unreported mainly because they have not yet been discovered. These leaks can enter the ground, seep into an aquifer and contaminate a water supply. In some places, water wells have been closed down and people have had to vacate their homes. Even small amounts of petroleum in soil or groundwater can be tasted or smelled and can subsequently affect health.

Leaking petroleum storage tanks are a major source of groundwater contamination. The DEC/DEP estimates that there may be as many as 185,000 tanks storing petroleum, which are subject to state regulations. Many of these tanks are bare steel and were installed underground in the 1950s and 1960s. These tanks have weakened by rust and have a fifty percent chance of developing leaks.

FINDINGS

There are two (2) 550-gallon underground storage tanks (USTs), which have been abandoned in place, located in basement area of 320-328 West 36th Street. The tanks were utilized to house gasoline.

From March 20-22, 2001, proper abandonment of the tanks was conducted. The tanks were drained of gasoline/water mix (approximately 1,100 gallons) and disposed of. Soil samples were taken and analyzed. The results did not indicate any contamination.

On Saturday, March 24, 2001, the tanks were filled with concrete slurry. The slab, which was broken up during the investigation was repaired. A New York City Fire Department Affidavit was filed upon completion of the job.

4.6.6 ABOVEGROUND STORAGE TANKS (AST)

No aboveground tanks or storage drums were observed in any of the accessible areas at the time of our inspection.

4.6.7 ELECTRICAL TRANSFORMERS (PCBs)

Transformers often contain poly-chlorinated biphenyl (PCB) Askarel coolant liquid and are generally used in hazardous locations where flammability is of concern. PCB transformers are no longer produced because of EPA's ban on the manufacture of new equipment containing PCBs. However, older equipment does remain in certain areas and may contain PCBs.

As of January, 1979, Polychlorinated Biphenyls (PCB) and other toxic materials used in fluorescent ballasts were phased out. Any building constructed prior to 1979 may contain PCB in minor quantities and is not considered a major health threat.

Further evaluation goes beyond the scope of a Phase I Environmental Report. Should you need any additional information, a technical engineer may be contacted for assistance.

FINDINGS

No electrical transformers were observed on the property.

As per the Toxic Substance Control Act (TSCA), the transformer owner, i.e. the utility company, is responsible for all transformer maintenance and all spills of PCBs from their transformers.

Fluorescent light fixtures were not inspected for PCB content under the scope of this assessment.

4.6.8 NATURAL GAS

The site does not utilize natural gas.

4.6.9 VAPOR ENCROACHMENT /VAPOR INTRUSION CONDITION

A Vapor Encroachment Condition (VEC) is defined by ASTM E2600-10 as "the presence or likely presence of contaminant of concern (COC) vapors in the subsurface of the Target Property (TP) caused by the release of vapors from the contaminated soil or groundwater or both either on or near the TP".

Vapor Intrusion (VI) occurs when contaminant of concern (COC) vapors enter a structure from the subsurface and impact the indoor air quality (IAQ) of a building. At high enough concentrations, vapor intrusion may present a health risk to the building's occupants.

MECC conducted a review of historical resources and regulatory database listings to identify any potential sources of contamination at the subject site that may result in Vapor Encroachment or Vapor Intrusion. In addition, MECC has reviewed available information for surrounding properties within the appropriate search distances to identify potential sources of a VEC/VIC at the subject site.

This is not intended to meet the criteria of a Vapor Encroachment Screen (VES) as outlined by ASTM E2600-10 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transaction. This is beyond the scope of a Phase I ESA.

FINDINGS:

The subject property is listed as an "E" designated lot.

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCDEP

before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCDEP, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

As previously outlined, an "E" designation only needs to be complied with during the redevelopment of a site. Part of the "E" designation submittal includes architectural drawings on the proposed development.

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

The existence of an "E" designation does not automatically assume that any contamination or Underground Storage Tanks (USTs) exist. The "E" designation is a "flag" levied on the site to be further evaluated.

Based on the fact that the site is "E" designated, consideration should be given to the potential for a Vapor Encroachment/Intrusion Condition (VEC/VIC). A Focused Sub-surface Investigation (FSSI) including soil and groundwater sampling will aide in determining if any sub-surface impacts are present and can better define whether a VEC exists at the site.

4.6.10 NON-SCOPE ASTM CONSIDERATIONS

There may be environmental issues or conditions at a property that parties may wish to assess in connection with commercial real estate that are outside the scope of this practice (the non-scope considerations). Some substances may be present on a property in quantities and under conditions that may lead to contamination of the property or of nearby properties but are not included in CERCLA's definition of hazardous substances (42 U.S.C. §9601(14)) or do not otherwise present potential CERCLA liability. In any case, they are beyond the scope of this practice. There may be standards or protocols for assessment of potential hazards and conditions associated with non-scope conditions developed by governmental entities, professional organizations, or other private entities. Asbestos-Containing Building Materials, Lead-Based Paint, and Radon are several non-scope considerations that persons may want to assess in connection with commercial real estate.

A. ASBESTOS

The EPA has identified over 3,000 products used in buildings containing asbestos fibers. Our inspection of the premises is to determine the presence of **friable asbestos**, as defined by the Federal Environmental Protection Agency as any material, which may be pulverized with hand pressure. This material has the potential to release asbestos fibers into the atmosphere and in turn may be hazardous to the building occupants' health.

We have not inspected for or included in our report any building materials, which may contain non-friable asbestos such as vinyl asbestos floor tiles, exterior asbestos shingles, asbestos roofing felts, etc. Many of these materials are still manufactured today and not considered hazardous unless the material is cut, sawed, or grounded in a manner that might release asbestos fibers into the atmosphere.

We have used the 4-category system as defined by Asbestos Hazardous Emergency Response Act (AHERA) to designate the different conditions of asbestos noted throughout the areas of the site. This report is not designed to meet the AHERA protocols.

1. Good Condition
Material with no visible damage or deterioration to very limited damage or deterioration.

2. Fair Condition
Material with one or more of the following characteristics:
 - *A few water stains or less than one tenth of insulation with missing jackets.*
 - *Crushed insulation or water stains, gouges, puncture or mars on up to one tenth of the insulation if the damage is evenly distributed (or up to one quarter if the damage is localized).*

3. Poor Condition
Material with one or more of the following characteristics:
 - *Missing jackets on at least one tenth of the piping equipment.*
 - *Crushed or heavily gouged or punctured insulation on at least one tenth of pipe runs/risers, boiler, tank duct, etc., if the damage is evenly distributed (one quarter if the damage is localized).*

4. Significantly Damaged

Thermal systems insulation on pipes, boilers, tanks, ducts, and other thermal system insulation equipment which the insulation has lost its structural integrity, or its covering, in whole or in part, is crushed, water-stained, gouged, punctured, missing, or not intact such that is not able to contain fibers. Damage may be further illustrated by occasional puncture, gouges, or other signs of physical injury to ACM; occasional water damage on the protective coverings/jackets; or exposed ACM ends or joints. Asbestos debris, originating from the ACM in question may also indicate damage.

ASBESTOS FINDINGS

No friable asbestos containing material was observed in any of the accessible areas of the 325 West 35th Street and 320-328 West 36 Street.

At the time of our inspection, no access was possible to 321-323 West 35th Street. Based on the age of the building, Asbestos Containing Materials (ACM) are assumed to be present. Since the building is currently vacant, any potential ACM should be addressed during any renovations /redevelopment of the site.

Many buildings' fireproofing is concealed in a plenum above the ceiling. These areas were not accessible and, therefore, we are unable to determine the type of fireproofing for those areas above the first floor.

B. LEAD BASED PAINT

Lead-based paint (LBP) was used extensively in buildings and structures that were constructed prior to 1978 and can be hazardous when damaged (i.e., chipped, broken, crumbling, pulverized); lead is toxic to humans particularly to children, if ingested, inhaled, or otherwise absorbed. Exposure to lead can cause health problems in children ranging from damage to the brain and nervous system, behavioral and learning problems (such as hyperactivity), slowed growth, hearing problems and headaches. In adults the health problems can range from difficulties during pregnancy, other reproductive problems, high blood pressure, digestive problems, nerve disorders, memory and concentration problems and muscle and joint pain.

Our research indicates the buildings were constructed **prior to 1978**, and lead based paint is assumed to be present throughout the buildings.

FINDINGS

The painted surface in the common areas inspected by Merritt Environmental Consulting Corp's staff did not demonstrate signs of peeling or cracking. No samples of the paint were analyzed since this is beyond the scope of this Assessment.

At the time of our inspection, no access was possible to 321-323 West 35th Street. Based on the age of the building, Lead Based Paint (LBP) are assumed to be present. Since the building is currently vacant, any potential LBP encountered should be addressed during any renovations /redevelopment of the site.

Research of the Housing Preservation and Development (HPD) Department records did not reveal any lead based paint violations against the subject site (See Appendix A).

In addition, the site is not used for residential purposes.

A lead based paint survey in accordance with The Housing & Urban Development (HUD) guidelines was not conducted under the scope of this assessment.

C. MOLD

Our on-site inspection did not reveal any visible evidence of mold or mold spores in any of the accessible areas inspected.

At the time of our inspection, no access was possible to 321-323 West 35th Street. Since the building is currently vacant, any mold encountered should be addressed during any renovations /redevelopment of the site.

D. RADON

Radon first gained national attention in early 1984, when extremely high levels of indoor radon were found in areas of Connecticut, Pennsylvania, New Jersey, and New York. Radon is a colorless, odorless radioactive gas. Nearly one out of every 15 homes in the U.S. is estimated to have elevated annual average levels of indoor radon. EPA established a Radon Program in 1985 to assist States and homeowners in reducing their risk of lung cancer from indoor radon.

FINDINGS

The New York State Department of Health indicates the average radon level for this area of Manhattan to be 1.4 picocuries per liter (pCi/L), which is below the EPA action level of 4 pCi/L.

A radon canister was not initiated at the time of our inspection since this is beyond the scope of this assessment.

4.7) INTERVIEWS

4.7.1 INTERVIEW WITH OWNER

The owner was not present during our inspection.

4.7.2 INTERVIEW WITH SITE REPRESENTATIVE

During our on-site visit, we interviewed Mr. David Kalush, who is the broker with Massey Knakal.

Copies of the above records of communications are included in Appendices, Section 10.6.

4.7.3 INTERVIEWS WITH OCCUPANTS (TENANTS)

No other individuals were interviewed regarding the facility.

4.7.4 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

We are researching the New York Health & Fire Department records for any information of hazardous operations including, past spills, leaks or violations. The information has not yet been provided. We will forward any information that appears to impact the scope of this assessment.

Research of the New York City Building Department indicated the following:

The subject property is documented as an "E" designated lot at the NYC Department of Buildings. According to a NYCDOB memorandum (12/23/03), "E" designated lots are amendments to the New York City Zoning Maps that may include environmental designations of certain tax lots that have physical or historical evidence of uses related to hazardous materials. Zoning Resolution 11-15 provides that the Department of Buildings may not issue a building permit for work on a tax lot labeled "E", until the Department of Buildings is provided with a report from the Department of Environmental Protection stating that the environmental requirements for the lot have been met.

The process to remove an "E" designation and receive a notice of satisfaction includes the following:

- Submitting a work plan to the New York City Department of Environmental Protection
- Conducting a sub-surface investigation
- Submit results to the New York City Department of Environmental Protection

The process can take several months and cost over \$20,000 to satisfy the requirement for removing an "E" designation. However, the "E" designation is only addressed during the redevelopment of a site.

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCDEP, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

As previously outlined, an "E" designation only needs to be complied with during the redevelopment of a site. Part of the "E" designation submittal includes architectural drawings on the proposed development.

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

The existence of an "E" designation does not automatically assume that any contamination or Underground Storage Tanks (USTs) exist. The "E" designation is a "flag" levied on the site to be further evaluated.

4.7.5 INTERVIEWS WITH OTHERS

No additional interviews were conducted as part of this assessment.

A questionnaire was forwarded to Mr. Lance Steinberg on October 5, 2012. We have not yet received a completed questionnaire (See Appendix A).

4.8) REPORT FINDINGS

Based on our site reconnaissance, database review and historical investigation, the following Recognized Environmental Conditions (RECs) were noted at the time of our inspection.

A Recognized Environmental Condition means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substance or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under compliance with laws.

The subject property is documented as "E" designated lots at the NYC Department of Buildings:

The "E" designations would require that the fee owner of the site conduct a testing and sampling protocol and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings. Once approval is granted by the NYCDEP, the work can be performed in accordance to required regulations in order to receive a notice of satisfaction.

As previously outlined, an "E" designation only needs to be complied with during the redevelopment of a site. Part of the "E" designation submittal includes architectural drawings on the proposed development.

The existence of an "E" designation does not automatically assume that any contamination or Underground Storage Tanks (USTs) exist. The "E" designation is a "flag" levied on the site to be further evaluated.

MECC has not been informed of the future usage of the site. Therefore, we cannot comment on the time frame in which the "E" designation would need to be addressed.

In addition, no de minimis conditions were noted.

A de minimis condition is one that generally does not present a material risk of harm to public health or the environment and that generally would not be subject of an enforcement action if brought to the attention of appropriate governmental agencies (excluding local asbestos & lead situations).

NON-SCOPE CONSIDERATIONS

There may be environmental issues or conditions at a property that parties may wish to assess in connection with commercial real estate that are outside the scope of this practice (the non-scope considerations). Some substances may be present on a property in quantities and under conditions that may lead to contamination of the property or of nearby properties but are not included in CERCLA's definition of hazardous substances (42 U.S.C. §9601(14) or do not otherwise present potential CERCLA liability. In any case, they are beyond the scope of this practice. There may be standards or protocols for assessment of potential hazards and conditions associated with non-scope conditions developed by governmental entities, professional organizations, or other private entities. Asbestos-Containing Building Materials, Lead-Based Paint, and Radon are several non-scope considerations that persons may want to assess in connection with commercial real estate.

ITEM

1	At the time of our inspection, no access was possible to 321-323 West 35 th Street. Based on the age of the building, Asbestos Containing Materials (ACM) and Lead Based Paint (LBP) are assumed to be present. Since the building is currently vacant, any potential ACM and LBP as well as any mold encountered should be addressed during any renovations /redevelopment of the site.

The following Historical Recognized Environmental Conditions (HRECs) were reported:

A Historical Recognized Environmental Condition (HREC) is an environmental condition which in the past would have been considered a Recognized Environmental Condition (REC), but which may or may not be considered a recognized environmental condition currently. Such as a past release of any hazardous substances or petroleum products which has been remediated, with such remediation accepted by the responsible regulatory agency (for example, as evidenced by the issuance of a no further action letter or equivalent).

There are two (2) 550-gallon underground storage tanks (USTs), which have been abandoned in place, located in basement area of 320-328 West 36th Street. The tanks were utilized to house gasoline.

From March 20-22, 2001, proper abandonment of the tanks was conducted. The tanks were drained of gasoline/water mix (approximately 1,100 gallons) and disposed of. Soil samples were taken and analyzed. The results did not indicate any contamination.

On Saturday, March 24, 2001, the tanks were filled with concrete slurry. The slab, which was broken up during the investigation was repaired. A New York City Fire Department Affidavit was filed upon completion of the job.

4.9 OPINIONS

Based on our site reconnaissance, database review, historical review and interviews with persons familiar with the subject site and adjacent properties, the above Recognized Environmental Conditions (RECs) and non-scope considerations were identified under the scope of services outlined in Section 4.2.2.

Based on our site reconnaissance, database review, historical review and interviews with persons familiar with the subject site and adjacent properties, no de minimis conditions were identified under the scope of services outlined in Section 4.2.2.

Executive Summary

This report provides geotechnical recommendations for the design and construction of a proposed 25-story structure located at 320-328 West 36th Street in the Borough of Manhattan, New York.

The subsurface conditions generally consist of red-brown coarse to fine sand (Stratum 1) with some silt, clay, and gravel inclusions overlying bedrock (Stratum 2). Cobbles and boulders were encountered within Stratum 1 in one boring. Bedrock was generally encountered within one foot below the existing cellar floor slab in three borings and was encountered at about 18 feet below the cellar floor slab in one boring to the south. Groundwater is estimated to be about 13 feet below the sidewalk, which corresponds to approximately el. +23 feet¹.

The recommended seismic site classification is Site Class C. If the proposed building is in Seismic Use Group I or II, the Seismic Design Category (SDC) is B. Liquefaction is unlikely.

Based on a cellar slab depth of 14 feet and assuming a foundation thickness of about three feet, it is estimated that Stratum 2 will be encountered for the central and northern portions of the site and Stratum 1 will be encountered at the southern portion of the site. Constructing isolated spread footings on rock and soil could result in unacceptable differential settlements at locations where a column bears on rock and an adjacent column bears on soil. In addition, it will be difficult to construct the footings at the transition zone because a foundation cannot bear partly on soil and partly on rock. Therefore, isolated spread footings are not recommended.

The feasibility of a mat foundation will depend on many factors, including the foundation types and depths of the adjacent buildings, the proposed building loads, and the estimated mat settlements. It is recommended that adjacent building information be obtained prior to selecting a mat foundation. The recommended maximum bearing capacity for a mat foundation bearing on Stratum 1 and Stratum 2 is 6 and 8 tsf, respectively, and the recommended moduli of subgrade reaction values are 150 and 250 pci, respectively. If the mat stresses or settlement are too high, especially close to the adjacent buildings, settlement reducing elements may be an option, but this will require additional analyses and determination of the cost effectiveness.

Based on the available subsurface information, it is difficult to accurately estimate where the mat will bear on Stratum 1 and where it will bear on Stratum 2. If this is critical to the design of the mat foundation, it is recommended that additional test borings be performed to better delineate where the mat will transition from Stratum 1 to Stratum 2.

If a mat foundation is not feasible, or desired, it is recommended that the building be supported on a combination of footings bearing on rock, piers to rock, and piles. Based on our experience, performing excavations below approximately 10 feet to install a pier to rock becomes impractical; therefore, if the rock is greater than 10 feet below the excavation level, it is recommended that piles be installed. Due to the relatively shallow rock conditions, it is recommended that drilled piles (i.e., caissons) be installed. Recommendations are given in the report for 200 and 400 ton caissons.

¹ Elevations are referenced to Borough President of Manhattan Datum, which is 2.75 feet above the National Geodetic Vertical Datum (Mean sea level. at Sandy Hook, NJ 1929). [BPMD = USGS – 2.75]

Executive Summary

The recommended design groundwater elevation is el. +26 ft. The bottom of the cellar slab will likely be below the design groundwater elevation; therefore, the below grade walls and cellar slab should be designed to resist groundwater pressures and they should be fully waterproofed.

Information regarding the foundation types and depths of the adjacent buildings has not been provided to us. If it is assumed that the foundations for the new buildings will be at a depth of 17 feet and that the adjacent buildings do not have deep cellars, underpinning of the adjacent buildings may be required. It is recommended that a site walk through of the adjacent structures be performed, a test pit plan be developed, and test pits be performed to document the size, depth, and type of foundation of the adjacent buildings, as well as any below-grade encroachments that may be present.

The report includes additional information regarding the subsurface conditions and foundation design recommendations and additional recommendations regarding excavation considerations, temporary groundwater control, underpinning, caisson installation, subgrade preparation, backfill and compaction requirements, pre-construction condition documentation and monitoring, and construction inspection and monitoring.

1.1 GENERAL

This report provides geotechnical recommendations for the design and construction of the proposed building at 320-328 West 36th Street in Manhattan, New York. The geotechnical evaluations and recommendations presented herein are in general accordance with the 2008 NYC Building Code (Code). Authorization to proceed was obtained in the form of an agreement between AC320 Hotel Partners, LLC c/o Flintlock Construction Services and URS Corporation – New York (URS), dated November 18, 2013.

Ground surface elevations were obtained from an “Existing Conditions Plan” prepared by WSP Transportation and Infrastructure, dated 7 January 2014. All elevations presented herein are referenced to the Borough President of Manhattan Datum (BPMD).

1.2 SITE DESCRIPTION AND PROPOSED DEVELOPMENT

The project site is located at 320-328 West 36th Street (Block 759, Lot 55) in Manhattan, New York and is referenced as Block 759, Lot No.55. The total lot size is about 8,230 ft² and is currently occupied by a two-story parking lot. The existing building has one below grade level about 11-feet below the sidewalk. The site has about 83-feet fronting the south side of West 36th Street and the sidewalk elevation fronting the existing building varies from about el. +35.3 to +36.6 ft. A site location plan is provided as Figure No. 1.

The site is bounded to the west by a 7-story brick structure (330 West 36th Street) and bounded to the east by a 5-story masonry structure (314-318 West 36th Street). The site is bounded to the south by a lot under development (excavation phase at time of investigation). The site is bounded to the south-west by a 5-story building with a rear yard that abuts the south property line of the site. The presence of any cellar levels of the adjacent buildings is unknown. Information regarding the foundation types and depths of the adjacent structures has not been provided to us.

The proposed development involves the construction of a new 26-story building (about 287-feet above sidewalk elevation). The latest architectural progress drawings, dated February 3, 2014, indicate that the building will have one cellar level with a floor to floor height of about 14 feet from the first floor level. The estimated finished floor elevation of the cellar is about el. +22 with localized deeper elevator pits at about el. +14. All proposed elevations are estimated and are to be finalized by the architect. Structural foundation loads were not developed at the time of writing this report.

1.4 REPORT ORGANIZATION

This report is divided into five sections. Following this section is a description of the subsurface investigation methods and results in Section 2. Section 3 summarizes the engineering evaluations and our recommendations. Construction considerations are addressed in Section 4. The limitations of this study are discussed in Section 5. Figures are provided at the end of the text. The boring logs and laboratory testing results are included in the appendices.

2.1 GENERAL

The subsurface investigation included a test boring and laboratory testing program to identify soil, rock, and groundwater conditions at the site. Details of the subsurface investigation are presented in the following sections.

2.2 SUBSURFACE INVESTIGATION

Four test borings, designated B-1 through B-4, were drilled between February 3 and February 10, 2014, in the cellar of the existing building. The borings were inspected on a full-time basis by a URS Geotechnical Engineer, under the direction of Mr. Jaime Rodger, P.E. The test boring locations are shown in Figure 2.

The URS test borings were performed by Warren George, Inc. of Jersey City, New Jersey using a track-mounted DK-50 restricted access drill rig. The borings were advanced using the mud rotary technique with a 3-7/8-inch diameter tricone roller bit. Soil samples were obtained in all borings using a 2-inch O.D. split-spoon sampler in accordance with American Society for Testing and Materials (ASTM) Standard Specification D1586-Standard Penetration Test (SPT). The SPT consists of driving a 2-in O.D. split-spoon for a depth of 24 inches with repeated blows of a 140-lb hammer free-falling 30 inches. The standard penetration or N-value is defined as the number of blows required to drive the sampler for a 12-in interval after an initial 6 inches of penetration. The split-spoon sampler was advanced using a donut hammer in all borings. The soil samples obtained from the borings were visually classified by the URS field inspector using the Unified Soil Classification System and the New York City Building Code designations. The recovered split-spoon samples were placed in properly labeled jars.

Rock coring was performed using a five-foot long NX (2-1/8 in. O.D.) core barrel. The top of rock was estimated based on the drilling operations (e.g., excessive rig chatter, difficult penetration) and practical spoon refusal as indicated by blow counts greater than 100 for a 6-inch interval on the split spoon sampler. Rock coring was performed to verify the presence of rock (instead of intercepting a boulder) and assess its relative quality, as indicated by Core Recovery² and the Rock Quality Designation (RQD)³.

A groundwater observation well could not be installed in any of the completed borings due to shallow bedrock and collapse of soil in the completed Boring B-4.

The test boring logs are included in Appendix A.

² The Core Recovery is defined as the ratio (expressed as a percent) of the total length of recovered core to the length cored.

³ The Rock Quality Designation (RQD) is defined as the ratio (expressed as a percentage) of the total length of recovered core samples having a length of at least twice the core diameter (e.g., about 4 in for NX-core) to the total length of core.

2.3 GENERALIZED SUBSURFACE CONDITIONS

The generalized strata descriptions provided below are based on our interpretation of the results of the subsurface investigation.

Stratum 1 – Sand (3b, 3a, 6)⁴ : This stratum generally consists of red-brown coarse to fine sand with some silt, clay, and gravel inclusions. Cobbles and boulders were encountered within this stratum in boring B-4. The N-Values typically range from about 60 to over 100 bpf, which is indicative of a very dense material. The thickness of this stratum varies from thin cover over rock in borings B-1, B-2, and B-3, and is about 18 feet thick in boring B-4.

Stratum 2 – Soft Rock (1d): This stratum was encountered below Stratum 1 at about 18 feet below the cellar slab in boring B-4, and at about below the existing cellar floor slab in borings B-1, B-2, and B-3. The soft rock consists of gray soft/weathered schist to schistose-gneiss with moderate to intensely spaced fracturing. The rock core recovery within the soft/weathered rock ranged from about 60 to 100% and the Rock Quality Designation (RQD) ranged from about zero to 38%.

The third rock core run made in boring B-4 from 25.5-feet to 29.5-feet below the cellar slab indicates an improvement of rock quality with core recovery of about 83% and RQD of about 46% indicative of Class 1c material.

Based on a geotechnical report prepared by Pillori Associates, as provided by Flintlock, four geotechnical test borings were performed at 321-325 West 35th Street, which is located along the southern property line. Based on the boring logs, soft/weathered rock to competent bedrock was encountered at about 26 to 31 feet below grade (about el. +11 to el. +6, respectively), at the time of the investigation. The depth to rock in boring B-4, which was performed closest to the southern property line of 320 West 36th Street, is approximately 29 feet below the West 36th Street sidewalk level. This depth is consistent with the test borings performed at 321-325 West 35th Street.

2.4 GROUNDWATER LEVEL

A groundwater observation well could not be installed in the completed borings due to the shallow bedrock. Groundwater readings taken at the 321-325 West 35th Street site in January 2013 indicate groundwater is about 14.5 feet below the sidewalk (i.e., about el. +23 ft).

The groundwater is expected to be perched on top of the bedrock and flowing through the fractures within the rock mass. The water is likely flowing towards the south of the site and forming the water table within the “rock basin” to the south.

Since groundwater measurements were not taken over an extended period of time, the measured groundwater level does not adequately reflect seasonal or other time dependent variations that may occur.

⁴ Number in brackets is the 2008 NYC Building Code soil classification designation.

3.1 GENERAL

This section presents engineering evaluations and recommendations for the design of the foundations and below grade structures. The evaluations and recommendations are based on the results of the subsurface investigation, our experience on other projects, and the information we have been provided to date on the design requirements for the proposed structure.

3.2 SEISMIC CONSIDERATIONS

Based on the soil profile, the recommended seismic site classification is Site Class C. Therefore, if the Seismic Use Group is I or II, the Seismic Design Category is “B”. The appropriate Seismic Use Group should be determined by the Architect or Structural Engineer.

Earthquake induced soil liquefaction is unlikely.

3.3 FOUNDATION RECOMMENDATIONS

3.3.1 Columns and Walls

Shallow Foundation

Based on a top of the cellar slab at about 14 feet below the sidewalk elevation and assuming a mat foundation thickness of about three feet, the bottom of the foundations will be approximately 17 feet below grade (i.e., about el. +19). At this depth, it is estimated that Stratum 2 will be encountered for the central and northern portions of the site and Stratum 1 will be encountered at the southern portion of the site.

Constructing isolated spread footings on rock and piers to rock is not likely to be feasible because of the significant excavations that would be required at the southern portions of the site to reach the rock. Constructing isolated spread footings on rock and soil could result in unacceptable differential settlements at locations where a column bears on rock and an adjacent column bears on soil. In addition, it will be difficult to construct the footings at the transition zone because a foundation cannot bear partly on soil and partly on rock. Therefore, isolated spread footings are not recommended.

A mat foundation will act to distribute the loads better and reduce the potential for differential settlement. However, the feasibility of a mat foundation will depend on many factors, including the foundation types and depths of the adjacent buildings, the proposed building loads, and the estimated mat settlements. If the adjacent buildings have multiple cellar levels or foundations that are located below the proposed foundations of the new building, it will be necessary to match the foundation level of the adjacent buildings and this may decrease the cost effectiveness of a mat foundation. We have not been provided information regarding the extent and depth of any below grade levels of the adjacent buildings. It is recommended that this information be obtained prior to selecting a mat foundation. The recommended maximum bearing capacity for a mat foundation bearing on Stratum 1 and Stratum 2 is 6 and 8 tsf, respectively.

The stresses on the soil from the building loads and mat settlements are estimated by performing mat structural analyses, which require a modulus of subgrade reaction value. For a mat

foundation bearing on Stratum 1 and Stratum 2, it is recommended that analyses be performed for a moduli of subgrade reaction values of 150 and 250 pci, respectively. The structural engineers' plots of estimated soil bearing pressure and settlement of the mat foundation should be provided to us for review. If the stresses or settlement are too high, especially close to the adjacent buildings, settlement reducing elements may be an option, but this will require additional analyses and determination of the cost effectiveness.

Based on the available subsurface information, we cannot accurately estimate where the mat will bear on Stratum 1 and where it will bear on Stratum 2. If this is critical to the design of the mat foundation, it is recommended that additional test borings be performed to better delineate where the mat will transition from Stratum 1 to Stratum 2.

If a mat foundation bearing on Stratum 1 and Stratum 2 is feasible and unsuitable material is encountered at the proposed bottom of the foundations, the unacceptable material should be excavated and replaced with the compacted structural fill. It is also recommended that a "mud-slab" (several inches of lean concrete) or a 4-inch thick minimum layer of $\frac{3}{4}$ inch gravel or crushed stone be placed on the subgrade prior to pouring the mat foundation. See Section 4.6 for the proper preparation of the subgrade.

Deep Foundations

If a mat foundation is not feasible, or desired, it is recommended that the building be supported on a combination of footings bearing on rock, piers to rock, and piles. The recommended allowable bearing capacity for footings and piers bearing on Class 1d rock is 8 tsf. Based on our experience, performing excavations below approximately 10 feet to install a pier to rock becomes impractical; therefore, if the rock is greater than 10 feet below the excavation level, it is recommended that piles be installed. Due to the relatively shallow rock conditions, it is recommended that drilled piles (i.e., caissons) be installed. In addition, pile driving may cause excessive vibration and settlement of the adjacent buildings, which are likely to be supported on a shallow foundation.

Caissons should be drilled through Class 1d rock and socketed into Class 1c, or better, rock. Based on the borings performed to date, there may be locations on the site where a significant amount of weathered (Class 1d) rock may be encountered. The amount of time needed to drill through this material adds uncertainty to the drilling cost and schedule.

Selection of the optimum /caisson capacity will depend on the building loads. Maximizing the caisson capacity will minimize the number of caissons and result in the most cost effective foundation. The final design of the caisson is often performed by the contractor, because some contractors have their preferred design methods and materials. For the purpose of preparing design drawings and evaluating costs, the following caisson sizes and capacities can be used:

Maximum Allowable Compression Capacity (tons)	Steel Casing Outside Diameter (see Note 1) (in.)	Steel Casing Thickness (in.)	Number and Size of Reinforcing Bars (see Note 1)	Maximum Allowable Uplift Capacity (tons)	Minimum Rock Socket Length (see Note 2) (ft)
200	9.625	0.545	1 - #24	150	10
400	13.375	0.48	2 - #24	200	10

Notes:

1. The estimated caisson capacities are based on steel casing and reinforcing bar minimum yield strengths of 50 ksi and 75 ksi, respectively. The casing shall be installed at least 1 foot into the rock. The reinforcing steel shall be installed through the cased and uncased (i.e., rock socket) portions of the caissons. The connection of the reinforcement to the pile cap shall be designed by others.
2. The rock socket length is based on the socket being in Class 1c rock or better. Axial load tests are not required to substantiate the caisson capacity; however, video inspection (special inspection) of the rock socket for each caisson is required.
3. The concrete/grout compression strength should be 6,000 psi.
4. The minimum center-to-center caisson spacing shall be 2.5 times the outside diameter, but not less than 4 ft.

The Code allows for a 1-ton lateral design load without performing additional lateral pile analyses or lateral load tests. If more than 1 ton lateral capacity is needed, it is recommended that lateral pile analyses or load tests be performed to determine if the selected pile(s) can resist the lateral loads.

3.3.2 Cellar Floor Slab

Assuming that the bottom of the mat foundation will be at a depth of approximately 17 feet, it is estimated that the cellar slab will be below the recommended design groundwater elevation (see Section 3.5). It is recommended that the cellar floor slab be designed as a slab-on-grade that resists hydrostatic pressures. The subgrade at the cellar level will require proper preparation, as included in Section 4.6, to reduce the potential for slab cracking.

3.4 LATERAL EARTH PRESSURES

The design lateral pressures for permanent below grade walls consist of static and seismic pressures that are influenced by the thickness and type of overburden material. It is recommended that the below grade walls above and below the design groundwater level be designed for a static lateral soil pressure of 45 pcf and 85 pcf, respectively. In addition, a seismic lateral soil force of $6H^2$ (lb/ft of wall), where H is the total vertical height of the foundation wall,

in feet, should be included. This force should be applied at a distance of $H/3$ from the top of the wall (i.e., wall pressure is an inverted triangle).

The recommended lateral pressure does not include any surcharge loads adjacent to the walls or at the ground surface. It is recommended that a uniform (i.e., rectangular) lateral pressure distribution of 0.40 times the surcharge be added to the lateral soil and rock pressure distribution. The structural engineer should determine the magnitude of the surcharge loads (i.e., live loads).

3.5 PERMANENT GROUNDWATER CONTROL

The groundwater level is expected to be about el. +23 within the sand material (Stratum 1), and either perched on top of the soft rock and/or flowing through fractures within the rock (Stratum 2). Considering that the groundwater level may fluctuate due to seasonal conditions, the recommended design groundwater elevation is el. +26 feet.

The bottom of the cellar slab will likely be below the design groundwater elevation; therefore, the below grade walls and slab should be designed to resist groundwater pressures and be fully waterproofed. Waterproofing materials should be installed on the outside of the perimeter walls (Grace Construction Products Bituthene 3000 for two-sided form applications and Preprufe 160R for blind side applications, or approved equivalent) and directly beneath the cellar floor slab (Grace Construction Products Preprufe 300R, or equivalent). The waterproofing on the perimeter walls should be installed to the ground surface. Waterstops should be installed at applicable locations.

Quality control is critical to a successful waterproofing project. Careful installation, diligent protection, and close full-time oversight are critical to produce a final product that limits the potential for seepage. It is recommended that a warrantee be obtained from the installer to cover materials and workmanship. Only certified installers approved by the product manufacturer should perform the work. The installation of all waterproofing elements should be inspected on a full time basis to confirm that the waterproofing is being applied as per the manufacturer's specifications and details. A representative of the manufacturer should perform final waterproofing inspection, in coordination with the waterproofing inspector, and approve all waterproofing work prior to concrete placement.

It is also recommended that the project team consider the benefits of a "sandwich" slab, which consists of the pressure slab, a gravel filled layer with perforated pipes connected to a sump pit, and a wearing slab. This system minimizes penetrations through the pressure slab and provides a way to manage water that may leak from the pressure slab or at connections between the pressure slab and the foundation walls or other critical locations.

4.1 GENERAL

This section presents a discussion and recommendations regarding special geotechnical aspects of the proposed construction, which should be addressed in the project specifications and contract documents.

4.2 EXCAVATION CONSIDERATIONS

Local temporary soil excavations above and below the groundwater level can have cut slopes as steep as 1.5H:1V and 2H:1V, respectively, unless steeper slopes are approved by the support of excavation (SOE) engineer. The slopes of any excavations adjacent to the existing structures should be no steeper than 2H:1V, unless approved by the SOE engineer.

All vertical soil faces will require temporary support until the new cellar walls and foundations are constructed and the area is properly backfilled. Considering the subsurface condition and proposed cellar level, a feasible support system at the north and south sides of the site may consist of soldier piles and timber lagging with sufficient lateral restraint (e.g., anchors, rakers, bracing, etc.), as required. The soldier piles at the north side of the site will need to be drilled into the rock.

Measurements of vibration levels should be made in selected adjacent structures during the installation of the support system. The maximum allowable vibration levels should be established as part of the pre-construction survey. Considering the proximity of the adjacent buildings, the vibrations from driving or vibrating the soldier piles may cause damage to the adjacent buildings; therefore, it is recommended that all soldier piles be drilled so that the vibrations are reduced.

The design and construction of any slopes and/or temporary excavation support systems should be the responsibility of a licensed New York Professional Engineer. All excavations and temporary support systems should conform to pertinent OSHA and local safety regulations.

4.3 UNDERPINNING

Underpinning will be required at locations where the foundations of existing adjacent structures are above the proposed excavation levels. Underpinning of the adjacent structures should transfer the foundation loads from their present bearing level to a level below the lowest excavation elevation of the proposed building.

As discussed in a previous section, information regarding the extent and depth of any below grade levels of the adjacent buildings is not known at the time of our investigation. It is recommended that information be obtained regarding the elevations, locations, and bearing grades of the foundations of the adjacent structures. It is recommended that a site walk through of the adjacent structures be performed for the purpose of determining the extents of the cellar level, the cellar depth, and any other features (e.g., elevator pits, ejector pits, etc.) that may affect the design and construction of the proposed new building. This information can then be used to develop a test pit plan. The purposes of the test pits are to document the size, depth, and type of foundation of the adjacent buildings, as well as any below-grade encroachments that may be

present. This information should then be reviewed for estimating underpinning needs and for development of underpinning drawings, as necessary.

Underpinning operations should be inspected full time during construction by a qualified engineer.

4.4 TEMPORARY GROUNDWATER CONTROL

If a mat is constructed, the groundwater should be maintained at least 2 feet below the bottom of the excavation, so that the foundation bearing surface can be adequately prepared. Based on the present design information, it is estimated that construction of a mat foundation may require excavations to depths of 17 feet (approximately el. +19 ft), with deeper excavations at the elevator and ejector pit locations. Assuming that the groundwater remains at about el. +23 ft, it is estimated that temporary dewatering will be required. Since the groundwater may be perched, it may be possible for the contractor to use sump pits and pumps to control the water. Discharge of groundwater to the sewer will require a discharge permit from the NYCDEP.

4.5 CAISSON INSTALLATION AND TESTING

If caissons are installed, they should be performed by a contractor with experience on similar projects. The contract specifications should require that the proposed contractor submit a construction procedure to the Engineer for review and approval prior to beginning the work. It is the responsibility of the contractor to use an installation method that will not cause damage to adjacent structures. The use of air or underreamers to advance the casing through the overburden may cause damage to adjacent structures if the air cannot be contained in the casing. Control of the air will depend on the drillers equipment, procedures, and experience. If the driller cannot control the air, they will have to switch to another method, which typically consists of using water with no air. The use of water to advance the casing may be much slower than using air; therefore, this should be taken into consideration when obtaining pricing from the contractor.

All aspects of the caisson installation should be inspected on a full time basis. The use of air during advance of the casing and the drilling of the rock socket should be closely monitored by the special inspector. Upon completion of the caisson drilling, the caisson should be thoroughly cleaned prior to installing the reinforcement and grout/concrete.

If caissons are installed, the Code requires that either a load test be performed or that each rock socket be inspected with a downhole video camera. Most projects perform a camera inspection of all rock sockets. The Contractor should provide appropriate equipment to provide clear and unobscured camera inspection of all rock sockets. The special inspector should be present during the camera inspection to confirm that the casing is well seated in the rock and that the rock socket consists of Class 1c, or better, rock.

4.6 SUBGRADE PREPARATION

The subgrade surface for a mat foundation or the cellar slab should be level and cleaned of loose soil, mud, and other material (such as concrete, brick, wood, debris, etc.) that can have a negative impact on the performance of the foundation or slab. If directed by the Special Inspector, the soil subgrade should be proof-rolled with a minimum of 6 passes of a smooth drum roller with a

minimum 1500 lb. static weight and minimum centrifugal force of 4,000 lbs, or similar approved equipment. Any unstable areas encountered which cannot be stabilized by additional compaction should be excavated to competent material and the area backfilled with compacted structural fill or ¾" stone. The proof-rolling should not be performed when the subgrade is wet, muddy, or frozen. If the foundations or floor slab are constructed in the winter, the subgrade should be protected from frost action to limit possible subgrade deterioration resulting from freezing and thawing cycles. The concrete should not be poured if the subgrade is wet, muddy, or frozen.

A 4-inch thick layer of compacted coarse aggregate, commonly known as ¾" gravel or crushed stone, or a "mud-slab" (i.e., 2 inches of lean concrete), should be placed on the approved subgrade so that the subgrade is properly protected from disturbance.

4.7 BACKFILL AND COMPACTION REQUIREMENTS

Select backfill or structural backfill should be granular soils free of cinder, brick, asphalt, ash, and other unsuitable materials. Such material should not contain any boulders or cobbles larger than about 4 inches across, and should have a fine content (material passing the No. 200 sieve) less than 15 percent. It is recommended that structural backfill or select backfill beneath the proposed building foundations be compacted to a minimum of 95% of the maximum dry density, as determined by ASTM D1557-88, Method C. All backfill should be placed in lifts not exceeding 8-in. in loose thickness. If requested by the special inspector, the subgrade underneath the backfill should be satisfactorily proofrolled prior to the placement of backfill. Backfill placed beneath slabs-on-grade, behind below-grade walls, and underneath sidewalks should be compacted to a minimum of 90% of the maximum dry density. Backfill placed in landscaped areas should be compacted to a minimum of 85% of the maximum dry density.

4.8 PRE-CONSTRUCTION DOCUMENTATION REPORT AND MONITORING

A pre-construction documentation report of the adjacent structures should be performed for the protection of the new building owner in the event of a future damage claim. This is also required by the NYC Department of Buildings. The report should include detailed documentation and photographs of the existing condition of the structures. Based on the survey results, a monitoring program should be developed for the purpose of checking the performance of the adjacent structures or utilities and for monitoring construction procedures. This monitoring program should include, at a minimum, recommendations for the location of survey points to monitor vertical and horizontal movements, locations for crack gauges, and locations for monitoring vibrations during key construction activities. The monitoring program should also include threshold levels for allowable movements and vibrations, and the procedures to be implemented if the threshold levels are exceeded during construction.

4.9 CONSTRUCTION MONITORING

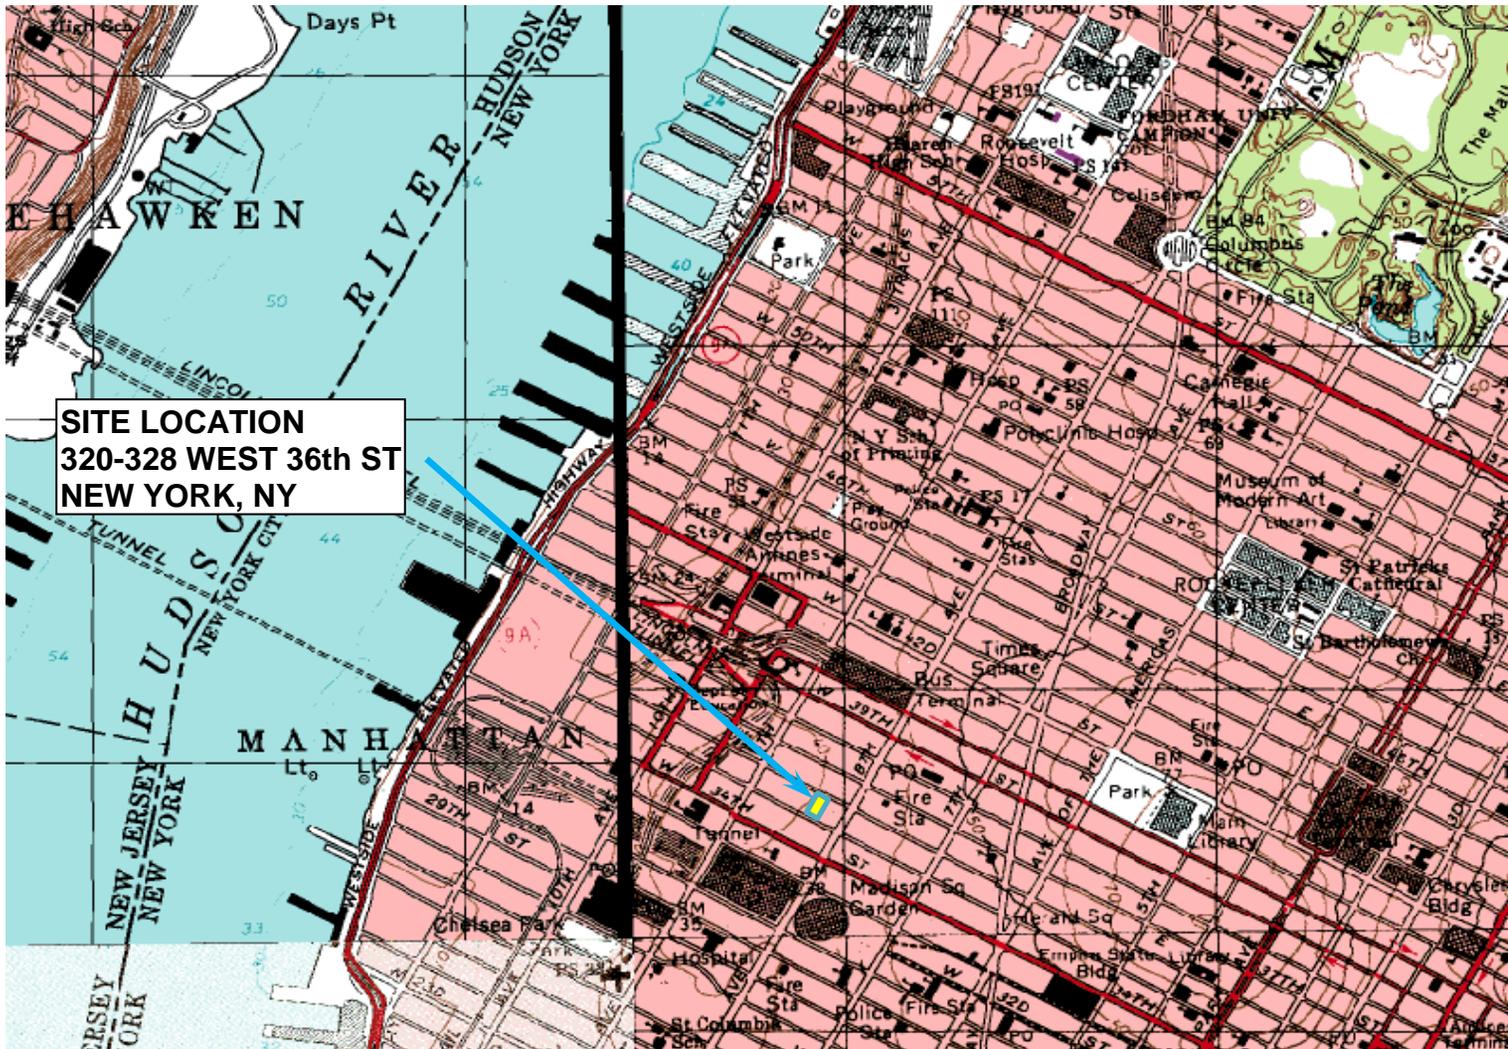

It is recommended that a geotechnical engineer familiar with the subsurface conditions and foundation design criteria, review the foundation contractors procedures and provide inspection services during excavation and foundation construction. Geotechnical related inspection services should include:

- Review and approval of contractor submittals related to foundation construction;
- Observation and documentation of all phases of excavation and foundation construction.
- Special inspection of the foundation subgrade.
- Full time special inspection of caissons.
- Monitoring of subgrade preparation and structural fill placement and compaction.
- Special inspection of underpinning (if required) and support of excavation.
- Monitoring of vibrations and review of monitoring data.

Professional judgments were necessary in relation to determining stratigraphy and soil properties from the subsurface investigations. Such judgments were based partly on the evaluation of the technical information gathered, and partly on our experience with similar projects. If further investigation reveals differences in the subsurface conditions and/or groundwater level, or if the proposed building elevations or design are different from those indicated herein, it is recommended that we be given the opportunity to review this new information and modify our recommendations, if deemed appropriate.

The results presented in this report are applicable only to the present study, and should not be used for any other purpose without our review and consent. This study has been conducted in accordance with the standard of care commonly used as state-of-the-practice in the profession. No other warranties are either expressed or implied.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on January 07, 2015 and listed below. The project was identified as your project: **7648-NYNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Notes and Definitions

QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-LSRD	Original sample conc <50 X reporting limit.
M-ACCB	Analyte in CCB. Run is bracketed by acceptable CCBs.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
Cal-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20% AND correlation coefficient <0.990 for quadratic fit).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants. Data users should consider anything <10x the blank value as artifact.
<hr/>	
*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

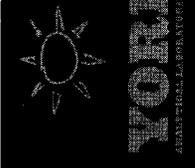

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on January 07, 2015 and listed below. The project was identified as your project: **7648-NYNY**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the attachment to this report, and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

General Notes for York Project (SDG) No.: 15A0147

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation, unless otherwise noted.
6. All analyses conducted met method or Laboratory SOP requirements. See the Qualifiers and/or Narrative sections for further information.
7. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.

Notes and Definitions

QL-03 This LCS analyte recovered outside of acceptance limits. The LCS contains approximately 70 compounds, a limited number of which may be outside acceptance windows.

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.
